Preface

Use the information in this guide if you are the administrator who will configure and maintain the TotalAgility installation.

Related documentation

The full documentation set for Kofax TotalAgility is available at the following location

<https://docshield.kofax.com/Portal/Products/KTA/7.6.0-d4fslp3xvr/KTA.htm>

In addition to this guide, the documentation set includes the following items:

- *Kofax TotalAgility Prerequisites Guide*: Provides system requirements for installing TotalAgility, instructions for running the prerequisite utility, and a software checklist for various installation types.
- *Kofax TotalAgility Installation Guide*: Describes how to install and configure TotalAgility.
- *Kofax TotalAgility Integration Server Installation Guide*: Describes how to install Kofax Integration Server and integrate it with other products.
- *Kofax TotalAgility On-Premise Multi-Tenancy Installation Guide*: Describes how to install and configure On- Premise Multi-Tenant system.
- *Kofax TotalAgility Configuration Utility Guide*: Explains how to use the Configuration Utility to update settings across various configuration files for different types of installation and deployment.
- *Kofax TotalAgility Architecture Guide*: Provides an overview of the TotalAgility architecture, covering various deployments for on-premise, on-premise multi-tenancy and Azure environments.
- *Kofax TotalAgility Best Practices Guide*: Describes the best practices you must follow when using TotalAgility to improve performance, cost, maintenance, availability and security.
- *Kofax TotalAgility Features Guide*: Provides an overview of the TotalAgility features.
- *Kofax TotalAgility Migration Guide*: Provides information on TotalAgility upgrades from different versions and post upgrade configuration.
- *Kofax TotalAgility Help*: Provides details about using TotalAgility to design business jobs and cases, assign resources, create forms, integrate with external applications, and more. Access the help from the TotalAgility application by clicking the Help button.
- *Kofax TotalAgility Workspace Help*: Describes how to use the Workspace to manage activities, jobs, and resources. Access the help from the TotalAgility Workspace by clicking the Help button.
- *Kofax TotalAgility On-Premise Multi-Tenant System Help*: Describes how to create and manage tenants using the TotalAgility On-Premise Multi-Tenant system.
- *Kofax TotalAgility Web Capture Control Help* : Provides details on using a Web Capture control in creating multi-page documents, creating a new document in a new folder, deleting pages that have been incorrectly scanned, and more; also, describes the buttons available in a Web Capture control toolbar.

- *Kofax Analytics for TotalAgility Product Features Guide*: Provides an overview of the dashboards that help you track data through the workflow, analyze the effectiveness of the processes and resources, and address business problems.
- *Kofax TotalAgility Tables*: Describes the Kofax TotalAgility tables and fields used by Kofax Analytics for TotalAgility.
- *Migration From Kofax Products Guide*: Provides information about migrating TotalAgility files and Kofax Transformation Modules projects to TotalAgility.

Training

Kofax offers both classroom and computer-based training that will help you make the most of your Kofax TotalAgility solution. Visit the Kofax website at www.kofax.com for complete details about the available training options and schedules.

Getting help with Kofax products

The [Kofax Knowledge Base](#) repository contains articles that are updated on a regular basis to keep you informed about Kofax products. We encourage you to use the Knowledge Base to obtain answers to your product questions.

To access the Kofax Knowledge Base, go to the Kofax [website](#) and select **Support** on the home page.

Note The Kofax Knowledge Base is optimized for use with Google Chrome, Mozilla Firefox or Microsoft Edge.

The Kofax Knowledge Base provides:

- Powerful search capabilities to help you quickly locate the information you need.
Type your search terms or phrase into the **Search** box, and then click the search icon.
- Product information, configuration details and documentation, including release news.
Scroll through the Kofax Knowledge Base home page to locate a product family. Then click a product family name to view a list of related articles. Please note that some product families require a valid Kofax Portal login to view related articles.
- Access to the Kofax Customer Portal (for eligible customers).
Click the **Customer Support** link at the top of the page, and then click **Log in to the Customer Portal**.
- Access to the Kofax Partner Portal (for eligible partners).
Click the **Partner Support** link at the top of the page, and then click **Log in to the Partner Portal**.
- Access to Kofax support commitments, lifecycle policies, electronic fulfillment details, and self-service tools.
Scroll to the **General Support** section, click **Support Details**, and then select the appropriate tab.

Chapter 1

About Transformation Server processes

TotalAgility uses the Transformation Server to process automatic activities (including Composite, Extraction, Classification, PDF Generation, and Image Processing). Multiple Transformation Servers can work within a single Kofax TotalAgility installation. It is server software that does processing of concrete tasks it supports (for example, Classification). It is designed as a separate component to remove CPU intensive processing from application and web servers on separate machines thus allowing these components to be more responsive.

Transformation Server connects with Kofax TotalAgility using direct database access with the SQL Server ADO.NET driver.

High-priority incoming activities

The Transformation Server normally uses an outgoing model where each Transformation Server periodically polls Kofax TotalAgility for new jobs. When a process requires an immediate response from a Transformation Server, create a job using the CreateJobAndProgress API. This performs a synchronous activity that executes all capture activities as quickly as possible through Transformation Server and then stops at the first manual activity in a process (such as Validation).

Transformation Server uses all available slots to process the pushed calls, you can add the reserved slots to increase responsiveness on push calls. Reserved slots only guarantees that processing can be started immediately. However, if all slots are busy (include reserved ones) the call still will wait.

Password-encrypted pdf files

You cannot use the Transformation Server to process password-encrypted PDF files. Decrypt the password-encrypted files before passing them to Transformation Server.

Multiple instances of Transformation Servers

You can run multiple instances of the Transformation Server as part of your TotalAgility environment. You can add or remove instances of the Transformation Server without reconfiguring Transformation Server and TotalAgility itself.

Transformation Server pools

In a system where all activities require a similar amount of processing time, use multiple Transformation Servers in a single pool. For greater control over more complex processes, use Transformation Server pools.

For example, in a medical claims processing solution, claims arrive in the following ways:

- Mail room: Large numbers of claims arrive through the mail room and are manually fed into high-speed scanners with 200 to 500 pages in each group. The system is continuously loaded.
- Internet Portal: Individual claims and small groups of claims arrive through the internet portal.
- Mobile Devices: Individual claims arrive through mobile devices.

The system must acknowledge receipt of claims that arrive from portal and mobile devices. Submissions through these devices are random and peaks are difficult to predict.

The large number of claims that arrive through the mail room can take longer to process than the individual claims and smaller groups that arrive through the internet and mobile devices. If the Transformation Server processes claims based on arrival time, an individual claim might be scheduled behind a large group of claims from the mail room. The processing time for the individual claim might be excessive.

Adding Transformation Server pools can prevent this problem. When designing TotalAgility workflow, create separate processes for urgent jobs from the internet portal and mobile devices, and long-running jobs from the mail room. Specify a Transformation Server pool for each Transformation Server supported activity, such as PDF Generation and Composite.

Example:

This example shows three pools:

- Pool A: Processes urgent jobs from the internet portal or mobile devices.
- Pool B: Processes long-running jobs from the mail room.
- Default Pool: Processes activities regardless of the assigned pool.

A Transformation Server can belong to only one pool.

- Transformation Server instances 1 and 2 are assigned to process activities from Pool A.
- Transformation Server instances 3 to 5 are assigned to process activities from Pool B.
- Transformation Server instances 6 and 7 are not assigned to a pool, so they execute all activities regardless of the assigned pool.

Partially completed activities

If you enable partial completion in a Transformation Server activity (including Composite, Extraction, Classification, and PDF Generation), the Transformation Server notifies TotalAgility when a document in a folder is fully processed and ready for further processing, even though other documents in a folder are not yet ready for processing.

Note For an activity using the Partial Completion property, the folder structure validation logic is not executed by Transformation Server. For more information on the Partial Completion property, see the *TotalAgility help*.

Stopping the Transformation Server service

The Transformation Server Service can be controlled like other services from the command line or with Services under the Control Panel.

However, when the service receives the command to stop, the service is only allowed a limited time to end. The following steps occur when using the normal method of stopping the Transformation Server Service:

1. The service stops accepting or taking new work from the TotalAgility Core Worker.
2. The service continues to process unfinished activities for a limited time, which is usually less than two minutes.
3. Any activities that do not complete with this limited time are interrupted and suspended.
4. The service stops.

If you need more than a couple of minutes for activities to finish processing, you can send the following custom command to the service to stop it gracefully:

```
sc control KofaxTransformationServerService 186
```

When the service receives this custom command, the service may continue to run until it is idle. The following steps occur when you use the custom command to stop the Transformation Server Service:

1. The service stops accepting or taking on new work from the TotalAgility Core Worker.
2. The service continues to process unfinished activities for an indefinite time.
3. When all activities are complete, the service stops.

Note As hung background processes are not detected, the service may never end in this case. However, 24-hour timeouts are likely to end any hung processes.

If using the custom control command, we recommend to stop the service if it is still running after two hours. It is likely that a child background service is hung so using the normal stop command will end the process.

The service also allows Pause and Continue commands.

- Pause: The service continues to process current activities, but does not accept or take on new activities. The service eventually goes idle, but does not stop or exit.
- Continue: The service resumes taking new activities.

The command line syntax for all aspects relating to the Transformation Server service are as follows.

Syntax	Description
<code>sc start KofaxTransformationServerService</code>	The regular start command for the service.
<code>sc stop Kofax TransformationServerService</code>	The regular stop command for the service.
<code>sc control KofaxTransformationServerService 186</code>	The custom stop command that allows all current work to complete before the service stops.

Syntax	Description
sc pause KofaxTransformationServerService	The command to pause the service.
sc continue KofaxTransformationserverService	The command to start the service again after is has been paused so that the normal activity can resume.

Chapter 2

Kofax Reporting for the Capture Client

Kofax Reporting provides information about Kofax TotalAgility usage, including scanning, review, validation, verification, import, and export. This feature enables you to track the efficiency of the system and users.

The server records Capture Client activities and sends the information to the reporting library whenever an activity occurs that requires reporting.

Activities recorded

All document and page editing activities are recorded, including those performed by custom .NET activities. Recorded activities include:

- Document actions:
 - Create
 - Delete
 - Override/restore document problem
 - Reject/unreject document
- Page actions:
 - Annotate/Remove annotation
 - Delete
 - Rotate

The following Capture Client activities have special labels:

- Page creation activities (whether by scanning or importing) are recorded as "Page scan" actions.
- Moving a document within a folder, to a different folder, and moving a folder with a document generate a "Document move" action.
- Moving a page within a document generates a "Page move" action for the following operations:
 - Moving a page within a document.
 - Moving a page from one document to another.
 - Splitting a document with the MovePages parameter.
 - Combining documents.

Validation and Document Review modules maintain document separation statistics for the following activities:

- Correct splits
- Wrong splits

- Missing splits

These statistics are reported to the server when the activity is completed.

Keystrokes

Keystrokes are counted for documents and fields. A Complete activity causes the following to happen:

- Documents with positive key counts are included in the event data passed to the server.
- The keystroke counter is reset to zero.

Keystrokes used in folder operations are not reported.

The following rules determine how the system records keystrokes and whether the rules apply to documents or fields:

Recorded keystrokes on the document

- Field navigation keys (Tab, Up Arrow, and Down Arrow)
- Keystrokes on read-only and disabled fields
- Keystrokes that change a document field
- Keystrokes made on the Document Type field

Recorded keystrokes on the field

- Confirmation keys (Enter to confirm and Ctrl+Enter to force validation)
- When the focus is on the Navigator, Image View, Thumbnails, and Current Error panels, keys pressed to bring the focus to active field (as highlighted in yellow)—recorded as keystrokes on the field. The exception is Enter, which is recorded as a keystroke on the document.
- All other keystrokes that are sent to a field—recorded as keystrokes on the field and the document.

Keystrokes that are not counted

- Keystrokes made on the Folder and Activities tabs
- The Alt, Shift, Ctrl, and Print Screen keys

Chapter 3

Kofax Message Connector

Kofax Message Connector is a Windows service responsible for importing messages and files in many electronic formats. It retrieves documents from various sources and saves them in its internal storage making them available for retrieval through a web service interface. Kofax TotalAgility connects to the Message Connector web service interface and retrieves the documents for import.

Kofax Message Connector can import messages and files from:

- Email messages including attachments using various email protocols (SMTP, POP3, IMAP, EWS)
- Fax messages (through internal fax over IP server or external fax servers: Kofax Communication Server, RightFax, Biscom)
- Files from a local or network folder

This chapter provides important information about configuring and operating Kofax Message Connector, including:

- Instructions for configuring Kofax Message Connector.
- Instructions for integrating with third party environment, such as fax servers or email servers.
- Instructions for operating and monitoring Kofax Message Connector.

Note Kofax Message Connector is also used with slightly different functionality in other Kofax products.

Deployment scenarios

The two main components, Kofax Message Connector and Core Worker service can be installed on the same computer or on different computers. One Core Worker service can connect to multiple Message Connectors. However, a single Message Connector must not be polled by multiple Core Worker services. This section describes some of the most typical scenarios.

Note To restrict the HTTP access of Message Connector for security reasons, we recommend that you set the Local IP Address field in the HTTP settings using one of the following.

- Specify the local IP address (127.0.0.1) to limit the access to a local machine in case of a standalone deployment.
- Specify the local IP address of any network adapter to limit the access to a specific network.

In TotalAgility, when configuring the import connection settings for emails, make sure that you specify the same IP address in the Message Connector URL field on the Import Connections page.

Standalone scenario

In this scenario, Message Connector and Core Worker service are installed on the same computer. This configuration does not offer any load balancing or failover mechanisms. You can easily run this on virtual environment for tests and demonstrations.

Load-Balancing scenario

In this scenario, a single instance of Core Worker service connects to two (or more) Message Connector instances. Each instance runs on a separate computer. This configuration is recommended if you need to process many messages quickly. As document conversion can be time consuming having multiple Message Connectors, you distribute the conversion load to several computers.

You can also install multiple instances of Message Connector on a single computer. This does not speed up document processing but helps you to prioritize documents. For example, a customer needs two electronic imports, SMTP email and fax. Customer expects large volume of email traffic and fewer high-priority faxes. By assigning fax import to a dedicated instance of Message Connector, customer can ensure that faxes are not stuck in the queue behind emails.

Failover scenario

In this scenario, two or more computers with Kofax Message Connector are grouped in a Windows failover cluster. Documents are routed to the active node. When that fails, the next node continues without longer service interruption.

High performance scenario

In this scenario, multiple computers run in parallel and import documents from folder.

For optimal performance, install both Message Connector and Core Worker service on the same computer. Modify the value of the `Prefetched Messages` parameter in the Message Connector configuration to get additional performance. In our high-performance environment, the value 40 has yielded the best results.

Advanced configuration of Message Connector features

In most of the use cases it is sufficient to configure the import settings in the Kofax TotalAgility integration import configuration User Interface.

For specific use cases some advanced configuration parameters are available in a separate Message Connector configuration User Interface.

To open the Message Connector Configuration utility, from the Windows Start menu, select **All Programs > Kofax > Message Connector > Message Connector Configuration**. The Message Connector Configuration screen appears.

The following configuration parameters do not apply to Kofax TotalAgility.

Tab	Configuration Parameter
Security Options	<ul style="list-style-type: none"> Disable Web Service Input
Document Conversion	<ul style="list-style-type: none"> Image to Pdf
Web-Service Input	<ul style="list-style-type: none"> Local IP Address HTTP Port HTTPS Port KC Plugin URL MC Cluster Enabled Local MC Cluster IP Address MC Cluster Port MC Cluster Members

Set Windows permissions for Message Connector

This section provides information about the Windows permissions required to run Message Connector.

Note

- The user who performs the installation must be a member of the local Administrator's group.
- An interactive user (logged-on user), or a user defined in the Message Connector's Document Conversion configuration only can perform the Microsoft Office document conversion.

Folder permissions

The following table lists the necessary folder permissions to run Message Connector.

Folder	Permission
ProgramData\Kofax\KIC-ED\MC	Full Control
Installation folder Note Message Connector installation folder.	Read
Temp folder (generally, Windows\Temp) Note You can modify this folder using Windows environment variables.	Full Control

Features and integration examples

This section provides examples on how to integrate Kofax Message Connector with third party software and hardware, and describes some advanced features of the product.

Connect to Biscom server

In addition to configuring the connection to the Biscom fax server in TotalAgility Designer, install the Biscom client software and identify a user/extension on the fax server for use with Kofax Message Connector. Work with your fax server administrator to configure the Biscom server.

Configure Biscom server

1. On the Biscom fax server, start the FAXCOM Administrator tool.
2. Create (or reserve) a user/extension for use with Kofax Message Connector.
3. Enable the network share connection to the Biscom server and note the service path.
4. Close the tool.

Install FAXCOM client

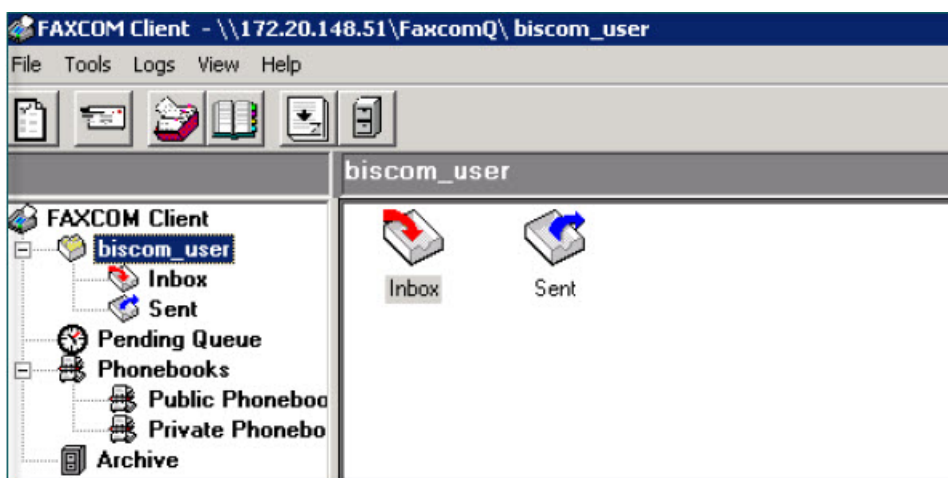

Install the Biscom client software, the FAXCOM Client on the computer(s) in which Message Connector is installed.

1. Run the following command if the computer in which the FAXCOM Client is installed belongs to a Windows domain and the user does not have access rights to the Biscom share:

```
Net Use <Biscom_service_path> /USER:<Biscom_user> <password>
```

2. Start the FAXCOM Client from the FAXCOM group of the Windows Start menu.
3. Enter the logon information and click **OK**.

Upon logon, the FAXCOM Client window opens.

4. Close the client.

Connect to Right Fax server

In addition to configuring the connection to the RightFax fax server in TotalAgility Designer, install RightFax client software and identify a user/extension on the fax server for use with Kofax Message Connector.

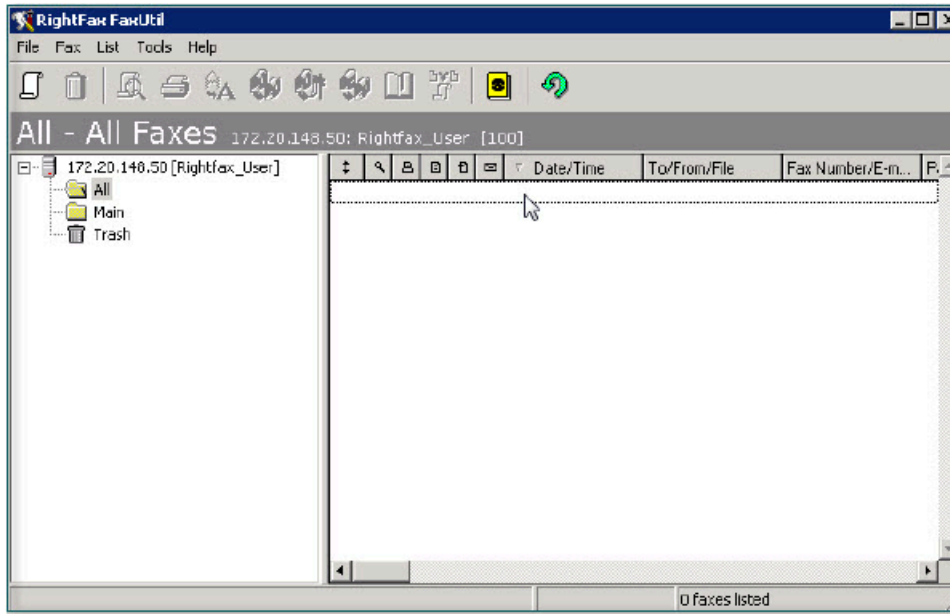

Configure RightFax server

1. On the RightFax fax server, start the **Enterprise Fax Manager** tool.
2. Create (or reserve) a user/extension for use with Kofax Message Connector.
3. Close the tool.

Install RightFax client

1. On the Message Connector computer(s), start the **RightFax Product Suite** setup.
2. When prompted to select the setup type, select **Typical Client**.
3. In the **RightFax Server Name** box, enter IP address or name of the fax server.
4. Click **Install**.
5. On the Windows Start menu, start **RightFax FaxUtil**.

6. Enter the logon information.
Keep the **Remember password** check box clear.
7. Click **OK**.
Upon logon, the RightFax FaxUtil window opens.

8. Close the client.

Forward faxes from multiple mailboxes to a single queue user

In Kofax TotalAgility, you can configure a single user for accessing RightFax. An administrator can have access to multiple mailboxes. If you do not want to use the administrator user for security reasons, consider setting up fax forwarding to a dedicated user, and use the credentials of this dedicated user in Kofax TotalAgility. Each fax user must configure fax forwarding using RightFax FaxUtil.

1. Start **RightFax FaxUtil** from the Windows Start menu and log on.
2. On the **Tools** menu, click **Options**.
3. On the **Receiving** tab, select **Forward Received Faxes to User**.
4. Select the dedicated user as the recipient of the forwarded faxes.
5. Confirm the changes and close FaxUtil.

Keep messages on RightFax server

By default, Kofax Message Connector deletes imported messages from the fax server. You can configure Message Connector to keep the messages on the fax server for processing later.

1. Navigate to the `MC\config` folder and open `SolutionConfig.xml` in an editor.
2. Add the following content between the `</SSL>` and `<CallPeerList>` lines:

```
<FaxServer>
<RFaxKeepMsgs>2</RFaxKeepMsgs>
</FaxServer>
```

3. Save and close the file.

Message Connector configuration now contains a new tab Fax Server with a single parameter “Keep messages on RightFax Server” set to “[2] yes”.

4. Start Message Connector configuration. Verify the value in the Fax Server tab.
5. Click **Save** and then click **Exit**.

Imported messages are no longer deleted from the RightFax server, instead, the text “KCFax:marked to delete” is added to the comment field and the flag FAXFLAG_GENERIC2 is set.

Connect to Kofax Communication server

In addition to configuring the connection to the Kofax Communication Server in TotalAgility Designer, identify a user/extension on the fax server for use with Kofax Message Connector.

Note For an external fax server, when you send an email with an attachment using KCS as a fax server type, TotalAgility only imports attachment of the email and cannot create a document for the email body. See *TotalAgility help*.

1. On the Kofax Communication Server, start the **TCFW Communication Server Client**.
2. Create (or reserve) a user/extension for use with Kofax Message Connector.
3. Optionally, if you want to import faxes received by multiple KCS users, set up fax forwarding for each of the user and forward the faxes to the created user.
4. Close the client.

Import PST files

Personal storage table (PST) files are used by Microsoft Outlook and other Microsoft products to store messages and other items. Use the following procedure to extract all messages from a PST file to a folder. Kofax Message Connector can then import the extracted messages to Kofax TotalAgility.

1. Start Windows Command Prompt in the Message Connector installation folder. The default location (for 64-bit operating system) is:

```
C:\Program Files (x86)\Kofax\KIC-ED\MC\bin\KFXConverter
```

2. Run the following command:

```
KFXConverter.exe -s <sourcepath>\<filename> -f <destinationpath>\ -type  
msg
```

3. Configure the following details:
 - a. For <source path>, enter the folder where your PST is located.
 - b. For <filename>, enter the name of the PST file to be imported.
 - c. For <destination>, enter the folder where the MSG files should be extracted.

4. Once extraction is complete, move the extracted files to a watched folder to import them to Kofax TotalAgility.

Note

- You cannot import the MSG files where attachments have been removed by any Microsoft Outlook archive tool.
- You can import multiple PST files simultaneously. However, when you run multiple KFXConverter instances in parallel, some information about the second and later instances might be missing from the log file. To ensure that your logs are complete, you can specify different log files for each instance using the command line switch: `-logfile <logfile>`

PDF normalization

When you select to normalize your message content to PDF, Kofax Message Connector normalizes all non-PDF parts of the message to an ISO-standardized version of PDF, the PDF/A. However, Message Connector can also normalize PDF parts to PDF/A.

Note

- If Microsoft Office is selected as normalization tool in **MS Office and selected Open Office documents**, normalization of excel documents result in PDF documents rather than PDF/A documents.
- Any embedded macros in Microsoft Office documents are ignored during document normalization.

Configure PDF variant

You can select one of several supported PDF variants by editing a batch file.

1. Open the folder `C:\Program Files (x86)\Kofax\KIC-ED\MC\Scripts` (assuming default installation path on a 64-bit operating system).
2. Edit the file `KFXConverter.bat` in a text editor.
3. Configure the type of PDF produced when converting non-PDF documents to PDF:

Note This step is required if you are using Kofax Converter for the normalization. If you are using a different converter, such as Microsoft Office, this setting does not modify the converted PDF type.

- a. Find the string `IF %ConvertToType%== "PDFA" (.`
- b. Edit the line immediately below `set ConvertToType="PDFA1B"`. The following values are supported:
 - PDF
 - PDFA1A
 - PDFA1B (default)
 - PDFA2B

4. Configure the type of PDF produced when normalizing existing PDF documents:
 - a. Find the string `IF %ConvertToType%== "PDFAn" (.`
 - b. Edit the line immediately below `set ConvertToType="PDFA1BN"`. The following values are supported:
 - PDF (disables PDF normalization)
 - PDFA1AN
 - PDFA1BN (default)
 - PDFA2BN
5. Save the file and close it.

Configure document normalization

Kofax Message Connector can normalize text, HTML, OpenOffice.org, and Microsoft Office documents to PDF. The images are not normalized to PDF, but they are always imported in their original format.

1. Start Message Connector Configuration utility from the Kofax group in the Windows Start menu.
2. Expand the **Document Conversion** tab.
3. If you want to extract documents from compressed files, select **Enable Decompression**. The following formats/extensions are supported: zip, rar, 7z, tar, gzip. Extraction happens before document normalization, that is, a Word document extracted from a zip file can be further normalized into PDF. Extraction is repeated if the extracted file is another compressed file (such as zip within zip) until all compressed files are extracted. Zip file containing multiple files with same name is also extracted. The following restrictions apply:
 - Password-protected compressed files are not extracted.
 - Archives split to multiple volumes are not supported.
 - EML documents from compressed files are not subject to further extraction/document normalization.
 - If the extraction ends without error, the compressed file is discarded. When archiving to folder is enabled, the extracted files are archived, not the compressed ones.
4. Select the tool for converting Microsoft Office documents.
5. Select the tool for converting HTML documents.
6. If you selected **OpenOffice.org** in step 3, make sure that you have installed the necessary extension. See section [Third-Party software](#).
7. If you selected **Microsoft Office** in either step 3 or step 4, and you are using the operating system Windows Server 2008 R2, Windows Vista, or later, you need to select the Windows user account to be used for Microsoft Office DCOM automation. For initial tests and troubleshooting, you may use the interactive user. For production use, you must specify an administrator user.
8. Click **Advanced**. In the **Security Options** tab, verify that document conversion is not disabled.
9. Click **Save**. Click **Exit and restart service**.

Configure Microsoft Office

Message Connector can use Microsoft Office for document normalization.

- Install a supported version of Microsoft Office on the same computer as Message Connector.
- Make sure that at least one printer is installed (required for Microsoft Excel document conversion).

- Start all applications (Word, Excel, PowerPoint) at least once and respond to the initial prompts.
- If you are using 64-bit version of Microsoft Office, create the folder `C:\Windows\System32\config\systemprofile\Desktop`.

Note Customers are responsible for providing appropriate licenses for third-party software.

Configure OpenOffice.org extension

Kofax Message Connector supports the normalization of Microsoft Office documents using Microsoft Office or OpenOffice.org. In case of OpenOffice.org, you need to install the Message Connector OpenOffice.org extension.

Note This component must be installed on the same computer as Message Connector.

1. Install a supported version of OpenOffice.org. Refer to [Third-Party software](#) for supported versions.
2. Shut down all OpenOffice.org processes (including Quickstarter).
3. From the installation media, browse to the `TotalAgility\KIC\Export\MC\OpenOfficeExtension` folder and start `setup.exe`.
4. Click **Browse**. Windows explorer displays the content of the installation folder.
5. Go to the folder `MC\OpenOfficeExtension` and start `Install.bat`.
6. Wait until the extension is installed.

You can manage installed OpenOffice.org extensions by selecting **Tools > Extension Manager** from any OpenOffice.org application menu. The extension list should include "Kofax Conversion for OpenOffice 1.0.". A properly installed extension has the symbol  indicating that this extension is installed for all users.

Configure Total HTML ConverterX

Message Connector can use Total HTML ConverterX for converting HTML documents, such as email messages in HTML format. Note the following:

- Download the software from <http://www.coolutils.com/TotalHTMLConverterX>. You can start with the trial version for initial testing.
- Install Total HTML ConverterX on the same computer as Message Connector. Use the default installation path.

Note Customers are responsible for providing appropriate licenses for third-party software.

Third-Party software

The following information applies to third-party software:

- Customers are responsible for providing appropriate licenses for third-party software.
- Install third-party software to their default installation path.

- Install the following third party application versions as required:
 - For normalizing Microsoft Office files, you can use the internal conversion tool (KFXConverter) or install one of the following:
 - OpenOffice.org (certified version 3.2)
 - Microsoft Office 2010
 - Microsoft Office 2013
 - Microsoft Office 2016
 - Microsoft Office 365
 - For normalizing HTML files, you can use the internal conversion tool (KFXConverter) or install one of the following:
 - Microsoft Office 2010
 - Microsoft Office 2013
 - Microsoft Office 2016
 - Microsoft Office 365
 - Total HTML ConverterX
 - For normalizing Open Office files (ODT, ODS and ODP formats), you can use the internal conversion tool, KFXConverter. For normalizing other Open Office document formats, use OpenOffice.org.

Note

- Do not install OpenOffice.org and Microsoft Office 2013 on a same computer as document normalization using Microsoft Office 2013 may fail.
- Use Internet Explorer to access Message Connector user interface.
- Third-party software such as Microsoft Office requires appropriate license. These licenses are not included in the Message Connector license.

Configure Kofax Converter

Configure the advanced settings of the Kofax Converter (KfxConverter) by editing the KFXConverter.ini file in a text editor. The ini file is located in the same folder as the Kofax Converter executable. The default location is: `C:\Program Files (x86)\Kofax\KIC-ED\MC\bin\KFXConverter\`.

Message Connector installs the KFXConverter_Default.ini file to the same folder. If the KFXConverter.ini does not exist when Message Connector starts, a copy of KFXConverter_Default.ini is created. An existing KFXConverter.ini is not modified by the setup.

The following parameters are available:

Note Fix the line breaks if you copy and paste the code from this guide.

Group	Parameter name	Default value	Description
EML2PDF	EnableMargin	False	If set to True, KfxConverter considers the margin parameters and the parameter PgNmDistFromHeader.
	LeftMargin	3.175 cm	Left margin of page (in centimeters).

Group	Parameter name	Default value	Description
	RightMargin	3.175 cm	Right margin of page (in centimeters).
	TopMargin	2.54 cm	Top margin of page (in centimeters).
	BottomMargin	2.54 cm	Bottom margin of page (in centimeters).
	PgNmDistFromHeader	1.3 cm	Page number distance from header (in centimeters).
	EnableFontSize	False	If set to True, KfxConverter considers the "FontSize" parameter, and all the converted PDF files will be of the same font size.
	FontSize	12	Font size in points.
	DateFormat		<p>Defines the date format. If empty, the default date format is used. Examples:</p> <ul style="list-style-type: none"> DateFormat="dd-MMM-yy" DateFormat="yyyy-MM-dd" <p>For more information, see http://msdn.microsoft.com/en-us/library/8kb3ddd4(v=vs.110).aspx</p> <p>Note Depending on the regional settings of your operating system, certain separators are not available. For example, a forward slash configured in the ini file might be replaced with a hyphen as date separator.</p>
	FitTableWidthToPage	True	<p>Resize the table width in an output PDF file when converting EML files (including body with message header).</p> <p>If set to true, KFXConverter sets the table width based on the page size in output PDF files.</p>
	ResizeLargeImages	2	<p>Resize the images that are larger in size.</p> <p>The following options are available:</p> <p>0 - Image is not resized.</p> <p>1 - The image size is compared with the section size of the document. If the image size is larger than the section size, image is resized to fit the section.</p> <p>2 - Free space is calculated based on whether an image is inline or floating. The image resize ratio to fit the page size is calculated as per the longer side of the image, and then the image is resized.</p> <p>Note If ResizeLargeImages is set to 0 when the input file contains large size images, file conversion may result in data loss.</p>
PDF2PDF	ALCWebServiceTimeout	1200 sec	Adobe Experience Manager web service timeout in seconds.

Group	Parameter name	Default value	Description
TEXT2PDF	FontType	Arial Unicode MS	Specifies the font type for the generated PDF. The font must be installed on the computer on which KFXConverter is used.
EXCEL2PDF	FitAllColumnsToOnePage	True	If set to True, all the columns are set to one page.
	PaperOrientation	-1	Defines the paper orientation. Default is -1, for Landscape 0, for Portrait 1
	PaperSize	Default	Disables the papersize setting.
	ConvertSheets	All	KFXConverter converts the pages according to the values specified in field. Possible values are: All, Active, 1, 2, 3 and so on. Specify the values as comma separated values. For example, ConvertSheets=Active,1 converts the first page and the active page, whereas ConvertSheets=All converts all the pages. Note If a blank page is selected for conversion and no printable area is selected in excel, KFXConverter ignores this page at the time of conversion. But, if a blank page with defined printable area is selected for conversion, KFXConverter converts this page into pdf.
	EnableMargin	False	If set to True, KFXConverter considers the margin parameters.
	LeftMargin	1	Left margin of page (in centimeters).
	RightMargin	1	Right margin of page (in centimeters).
	TopMargin	1	Top margin of page (in centimeters).
	BottomMargin	1	Bottom margin of page (in centimeters).
	HTML2PDF	EnableMargin	False
LeftMargin		0.3528 cm	Left margin of page (in centimeters).
RightMargin		0.3528 cm	Right margin of page (in centimeters).
TopMargin		2.54 cm	Top margin of page (in centimeters).
BottomMargin		2.54 cm	Bottom margin of page (in centimeters).
MHT2PDF	EnableMargin	False	If set to True, KFXConverter considers the margin parameters.
	LeftMargin	3.175 cm	Left margin of page (in centimeters).
	RightMargin	3.175 cm	Right margin of page (in centimeters).
	TopMargin	2.54 cm	Top margin of page (in centimeters).
	BottomMargin	2.54 cm	Bottom margin of page (in centimeters).

Group	Parameter name	Default value	Description
EXTERNAL RESOURCE LOADING	LoadExternalResources	True	If set to False, when converting EML or MSG documents, KFXConverter does not download any externally linked resource, for example, an image from an internet hyperlink.
GENERAL	OriginalDocumentFolder		If document conversion fails and path is valid, original file is saved at this path.
	EnablePageHeader	True	If set to false, KFXConverter disables the page number displayed on top of each page.
	EncodingType	UTF-8	If encoding type is defined in the input files, KFXConverter uses the same for converting the documents; otherwise, the default encoding type or the value specified for the EncodingType parameter is used. The encoding type is only applicable for HTML, MHT and EML file formats.

Group	Parameter name	Default value	Description																						
PDF2PDF/A	AllowedErrors	0	<p>If the Standard option is selected in PDF to PDF/A conversion engine field in Message Connector, the KFXConverter allows the document conversion with the specific conversion errors.</p> <p>To ignore one or more conversion errors and allow conversion, set the value of AllowedErrors to one error code or to a combination of error codes.</p> <p>If AllowedErrors=0, no error is allowed. All the error codes and all possible values generating from an OR operation of the error codes can be used to ignore one or more document conversion errors.</p> <p>The following table lists the error codes and description.</p> <table border="1"> <thead> <tr> <th>Error code</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>4</td> <td>Visual differences</td> </tr> <tr> <td>8</td> <td>Name collisions of colorants</td> </tr> <tr> <td>16</td> <td>Removing optional content groups (layers)</td> </tr> <tr> <td>32</td> <td>Removing transparency</td> </tr> <tr> <td>64</td> <td>Removing embedded files</td> </tr> <tr> <td>128</td> <td>Removing non-convertible XMP metadata</td> </tr> <tr> <td>512</td> <td>Removing of signatures while normalizing the signed document</td> </tr> <tr> <td>4096</td> <td>Normalizing corrupt input document</td> </tr> <tr> <td>16384</td> <td>Similar font substitution</td> </tr> <tr> <td>32768</td> <td>Removing interactive elements such as actions or annotations</td> </tr> </tbody> </table> <p>Examples:</p> <ul style="list-style-type: none"> • If AllowedErrors = 4, visual differences in the output file do not cause a document conversion error. • If AllowedErrors = 132, that is, combination of error code 4 and error code 128, conversion is done even if there are visual differences in the output file, or non-convertible XMP metadata is removed. 	Error code	Description	4	Visual differences	8	Name collisions of colorants	16	Removing optional content groups (layers)	32	Removing transparency	64	Removing embedded files	128	Removing non-convertible XMP metadata	512	Removing of signatures while normalizing the signed document	4096	Normalizing corrupt input document	16384	Similar font substitution	32768	Removing interactive elements such as actions or annotations
Error code	Description																								
4	Visual differences																								
8	Name collisions of colorants																								
16	Removing optional content groups (layers)																								
32	Removing transparency																								
64	Removing embedded files																								
128	Removing non-convertible XMP metadata																								
512	Removing of signatures while normalizing the signed document																								
4096	Normalizing corrupt input document																								
16384	Similar font substitution																								
32768	Removing interactive elements such as actions or annotations																								

Import MSG and EML files from folder

When you import MSG and EML files from a folder, these email messages are treated as received emails. The metadata, such as subject, to, from, date, are extracted directly from the email message. All content

selection and conversion options, such as converting to TIFF, adding a message header, importing only body or attachments, apply to the MSG or EML file.

Note If you are not importing MSG and EML files from a folder directly, but are using a controlling XML file which links these email documents, only the email body is converted and imported. The attachments are discarded, unless you select to include original content.

Import XFA files

You can import and normalize the PDF documents with Adobe XML Forms Architecture (XFA forms) using the Message Connector. To achieve this, Adobe Experience Manager Server is required.

Note If support for Adobe LiveCycle is available, you can also use Adobe LiveCycle for conversion of XFA Forms.

Following are the prerequisites for using Adobe Experience Manager Server:

- You must install and configure the Adobe Experience Manager Server to make it accessible to TotalAgility. The Output service must be running, and its web service must be enabled and working properly.
- Adobe Experience Manager software must be installed on a different computer than TotalAgility. However, to decrease the probability of timeouts and retries, we recommend that you install the software in the same network LAN segment.
- The minimum supported version of Adobe Experience Manager Server is 6.3.
- You must acquire the Adobe Experience Manager product through an appropriate Adobe Sales Channel. Kofax does not ship, install, support or troubleshoot the Adobe Experience Manager Server. The customer using this feature is responsible for any licensing requirements and maintenance contract and/or agreements required by Adobe, and any of third party vendor that may be involved.

Note

- Any limitations imposed by Adobe are applicable. For example, only XFA PDFs with no rights, signature, or certification can be converted to PDF or PDF/A. Refer Adobe Experience Manager documentation for more information.
- When an exception occurs while using Adobe Experience Manager, TotalAgility reports the exception in its log file, and the error is treated as a standard document conversion error.

To configure the Adobe Experience Manager Server, do the following:

- In Message Connector, specify the information for connecting to Adobe Experience Manager Server on the **Adobe Experience Manager** tab.
- In the Integration module of TotalAgility Designer, enable the Flatten XFA forms to PDF/A Documents Using Adobe Experience Manager setting when configuring the import source settings.

Note

- Enabling this setting may have impact on the performance as each PDF document is sent to document converter to determine whether it is XFA form or standard PDF.
- For more information on the import source settings, see the *TotalAgility help*.

Archive documents

TotalAgility can archive processed documents. To archive documents, specify a path to a folder under **Document Archiving** when configuring import sources in the Integration module of the TotalAgility Designer. When you import a document, based on the import result, TotalAgility creates and stores the document in one of the following folders:

- **OK**: Stores successfully imported messages.
- **PARTIAL**: Stores partially imported messages. For example, a message may be partially imported, if normalization of eDocuments is enabled and incoming message contains a DAT file.
- **REJECT**: Stores the rejected messages. For example, a message import may be rejected if decompression is not enabled in Message Connector and incoming message contains a zip file.

For each message, TotalAgility creates a subfolder under any of the above folders. For example, for a rejected message, a sub folder is created under the REJECT folder. Name format of the subfolder is `YYYYMMDDhhmmss_<Message ID>`. Where, Message ID is the unique ID assigned by Message Connector to a message on arrival.

Each individual subfolder stores the document in the following file formats:

- **File**: Contains the message body and all attachments in original file format as separate files.
- **EML**: Contains message body and the attachments as a single EML file.
- **XML**: Archives the message metadata as a single XML file.

Configure SSL connection

Using SSL connections, configure TotalAgility to operate in a secure environment.

1. Create a SSL certificate for each component that you want to connect securely. Use the following tools:
 - Microsoft Active Directory Certificate Services
 - OpenSSL
2. Configure each component that you want to connect securely:
 - For Message Connector, convert the certificate to .pem format so that you can copy the private key and the certificate to the configuration utility.
 - For TotalAgility, install the certificate using Microsoft Management Console (MMC) local account and copy the thumb print to the configuration utility.
3. Install the certificates on all computers that connect to a secure server.

See [Request a certificate for Message Connector using Microsoft Active Directory Certificate Services](#) for example.

Secure connection between Message Connector and TotalAgility

1. In the Message Connector Configuration, click **Advanced** to display additional configuration options.
2. On the **HTTP** tab, select **Ssl Active** to enable SSL.
3. On the **SSL Certificate** tab, edit the fields as needed. For production use, update the **SSL Certificate** field.

4. In the Integration module of TotalAgility Designer, enable the **Flatten XFA forms to PDF/A Documents Using Adobe Experience Manager** setting when configuring the import source settings.
5. Click **Test connection** to verify the connection.

Secure connection for incoming SMTP mail

1. In the Message Connector Configuration, click the **Email Inbound via SMTP** tab.
2. On the **SSL Active** list, select **ONREQUEST** or **ALWAYS** to activate the SSL protocol.
3. On the **SSL Certificate** tab, edit the fields as needed.

Secure connection for outgoing SMTP mail

In Message Connector Configuration, on the **Email Outbound** tab, select **ONREQUEST** or **ALWAYS** on the **SSL Active** field.

Secure connection for POP3/IMAP mail

1. In the Integration module of TotalAgility Designer, edit the connection for a POP3/IMAP type of import source.
2. Select **Always** or **On Request** for **SSL**.

Secure connection for Exchange Web Services

1. In the Integration module of TotalAgility Designer, specify the EWS **URL** when configuring the import source settings.
2. The prefix of the EWS URL in the field determines whether the connection is secure. Use https for secure connections.

Request a certificate for Message Connector using Microsoft Active Directory Certificate Services

This example explains how to use Microsoft Active Directory Certificate Services to generate a certificate for Message Connector and OpenSSL to extract the private key and certificate. The following requirements and additional information:

- Requirement for Microsoft Certification Services:
 - Configure the server for https binding (https://[CAName]/certsrv/).
 - Configure the server to archive the key.
 - Create a template which allows to export the private key.

- OpenSSL
 - To export a decrypted private key.
 - To create a PKCS#12 file.
- 1. Use Microsoft Certification Services to request a certificate.
 - a. Use a web browser to connect to the CA Server (<https://CAName/certsrv>).
 - b. Select **Request a certificate**.
 - c. Select **Advanced certificate request**.
 - d. Select **Create and submit a request to this CA**.
 - e. Fill out the necessary information in the form, and select the correct Certificate Template.
 - f. Select **Mark keys as exportable**. Enter the Message Connector server name in the **Name** box.
 - g. Click **Submit**. Wait until the certificate is issued.
 - h. Click **Install this certificate**. Wait until the certificate is installed.
- 2. Use Internet Explorer to export the certificate.
 - a. Go to Tools > Internet Options > Content > Certificates.
 - b. On the Personal tab, select the certificate and click **Export**.
 - c. Select to export the private key. Select **PKCS #12** as the format.
 - d. Type a password to protect the key.
 - e. Specify the location and file name, and click **Finish**.
- 3. Use OpenSSL to extract the private key and the certificate to .pem format. For example:

```
openssl.exe pkcs12 -in "c:\certif.pfx" -out  
"c:\certif.pem" -nodes
```

Provide the password used in Step4.
- 4. Open the pem file in a text editor. The certificate and private key for configuring Message Connector are available in this file. See [Configure SSL connection](#).

Filter source IP addresses for SMTP connections

Define filters in Message Connector to provide additional security. Use filters to allow SMTP connection requests from authentic IP addresses, and to avoid or reject requests from unsolicited IP addresses.

Note Filters are only applicable for requests from SMTP connections; requests from other connection types such as, HTTP are not filtered.

Message Connector Configuration provides an option to define list of filters in the **Source IP Filter** field of **Email Inbound via SMTP** tab. Using these filters, SMTP connections to Message Connector are either allowed or denied. By default, no filter is defined and connections are allowed from all IP addresses.

Each line in the **Source IP Filter** field defines a filter and starts with an Allow or Deny keyword, followed by the CIDR (Classless Inter-Domain Routing) notation of an IP range. These filters are compared with the source IP address of a request. If a source IP address falls in a category of a filter starting with Allow, the SMTP connection for that IP address is accepted.

For example, **Allow 10.20.30.0/24** allows request from IP addresses from 10.20.30.0 to 10.20.30.255.

The first matching filter defines whether the request should be allowed or denied. If filters are defined, but no filter matches the incoming source IP address request, the request is denied.

Supported formats for document normalization

TotalAgility support the following document formats for conversion with various third-party tools.

	Microsoft Office	OpenOffice.org	Total HTML ConverterX	Tools embedded in Message Connector	KFXConverter
Word documents ^{1, 8}	Yes	Yes		Yes	Yes
Excel documents ^{1, 8}	Yes	Yes		Yes	Yes
PowerPoint documents ^{1, 3, 8}	Yes	Yes		Yes	Yes
Text documents (both attachments and email body)	Yes	Yes		Yes	Yes
OpenOffice documents		Yes			Yes
HTML, MHT documents (both attachments and email body)	Yes		Yes	Yes	Yes
EML documents (email header embedded on the first page of email body) ⁶				Yes	Yes
MSG documents ^{4, 6}				Yes	Yes
PST files ⁶				Yes	Yes
PDF documents, including portfolio PDFs ^{1, 2}				Yes	Yes
compressed documents (zip, rar, 7z, tar, tz.gzip) ¹				Yes	Yes
XML documents ⁷				Yes	

	Microsoft Office	OpenOffice.org	Total HTML ConverterX	Tools embedded in Message Connector	KFXConverter
XML Paper Specification (xps) ⁸					Yes

1. Conversion of password-protected documents is not supported.
2. Conversion of PDF documents with XFA forms (Adobe XML Forms Architecture) created with Adobe Experience Manager Designer requires Adobe Experience Manager environment via network.
3. Conversion of PowerPoint documents with the extension .ppsx is not supported via OpenOffice.org.
4. MSG documents where attachments are removed by any Microsoft Outlook archiving function are not supported and they are treated as document conversion errors.
5. Require additional manual steps. See [Convert PST files](#).
6. For folder import only, EML and MSG files are treated as if the messages have arrived via email. The metadata of the message (and not the metadata of the file) is used.
7. Conversion might require third-party tools during configuration or customization. The tools are not required during operation.
8. KFXConverter supports conversion of Microsoft Office 2003 to Microsoft Office 2016 and Microsoft Office 365 documents. It also supports the conversion of XPS format.

Note Each conversion tool produces the desired output in a different way. As a result, switching to another conversion tool may change the look of your converted documents.

Supported input file formats and output PDF formats

Following table provides a list of all the input file formats supported by KFXConverter and the respective output (PDF or PDF/A) formats.

Input file formats	Output PDF formats	Output PDF/A formats
Doc, Docx, Dot, Dotx, Odt, Docm	PDF 1.5	PDFA1a
Xls, Xslx, Xlm, Xlt, Xltx, Xlsb, Xlam, Csv, Ods	PDF 1.4	PDFA1b PDFA2a
Ppt, Pptx, Pptm, Potx, Odp	PDF 1.5	PDFA2b PDFA2u
MHT file	PDF 1.5	PDFA3a
Html, Htm	PDF 1.5	PDFA3b
PDF-1.2 to PDF-1.7	Not supported	PDFA3u
Txt, Log	PDF 1.5	

Access other user's mailbox

In TotalAgility, you can access other user's mailboxes in one of the following ways:

- **Delegate access:** Use this option when one user need to act on behalf of another user and access one or few other users' accounts. For example, one user can access the shared mailboxes of three other users.
- **Exchange impersonation:** Use this option when a single user needs to access multiple users' accounts.

The following table lists the differences between Exchange impersonation and delegate access.

	Exchange impersonation	Delegate access
Administered by	Administrator	User
Used by	Exchange Web Services	Any mailbox client
Configuration	Per impersonator	Per shared mailbox
Rights	Broad	Granular

Permissions for Azure Active Directory application

For using MS Graph as an import source, create an application in Azure Active Directory and assign the following permissions.

API name	Permission name	Type
Azure Active	User.Read	Delegated
Directory Graph	Mail.Read	Delegated
	Mail.Read	Application
	Mail.Read.Shared	Delegated
	Mail.ReadWrite	Application
	Mail.ReadWrite	Delegated
	Mail.ReadWrite.Shared	Delegated
Exchange	Mail.Read	Delegated
	Mail.Read	Application
	Mail.Read.Shared	Delegated
	Mail.ReadWrite	Delegated
	Mail.ReadWrite	Application
	Mail.ReadWrite.Shared	Delegated

Registry settings to enable TLS v1.1 and TLS v1.2 support for EWS

For EWS to send TLS v1.1 and TLS v1.2 confirming requests and messages to Microsoft Exchange server, modify or add specific registry keys for both client (Message Connector) and Exchange Server.

Prerequisites:

- Install the required .NET Framework 3.5.1 updates to enable TLS v1.1 and TLS v1.2.
- For both client and server, upgrade .NET Framework for the applicable Operating System in use.

Note If a specific .NET Framework update is already installed or if an update is not required (in case a higher version of .NET Framework is already installed which support TLS v1.1 and TLS v1.2), following error is displayed: The update is not applicable to your computer.

Enable TLS v1.1 and TLS v1.2 for Message Connector

To enable TLS v1.1 on a computer where Message Connector is installed, add or modify the following registry sub keys.

Operating System Type	Registry Path	Sub key	Type	Description
64-bit	HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\.NETFramework\v2.0.50727	SystemDefaultTlsVersions	dword	Set this sub key value to 1
64-bit	HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Microsoft\.NETFramework\v2.0.50727	SystemDefaultTlsVersions	dword	Set this sub key value to 1
32-bit	HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\.NETFramework\v2.0.50727	SystemDefaultTlsVersions	dword	Set this sub key value to 1
32-bit/64-bit	HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\SecurityProviders\Schannel\Protocols\TLS 1.1\Client	DisabledByDefault	dword	Set this sub key value to 0.
32-bit/64-bit	HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\SecurityProviders\Schannel\Protocols\TLS 1.1\Client	Enabled	dword	Set this sub key value to 1.

To enable TLS v1.2 on a computer where Message Connector is installed, add or modify the following registry sub keys.

Operating System Type	Registry Path	Sub key	Type	Description
64-bit	HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\.NETFramework\v2.0.50727	SystemDefaultTlsVersions	dword	Set this sub key value to 1
64-bit	HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Microsoft\.NETFramework\v2.0.50727	SystemDefaultTlsVersions	dword	Set this sub key value to 1
32-bit	HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\.NETFramework\v2.0.50727	SystemDefaultTlsVersions	dword	Set this sub key value to 1
32-bit/64-bit	HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\SecurityProviders\Schannel\Protocols\TLS 1.2\Client	DisabledByDefault	dword	Set this sub key value to 0.

Operating System Type	Registry Path	Sub key	Type	Description
32-bit/64-bit	HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\SecurityProviders\Schannel\Protocols\TLS 1.2\Client	Enabled	dword	Set this sub key value to 1.

Enable TLS v1.1 and TLS v1.2 for Exchange Server

To enable TLS v1.1 on a computer where Microsoft Exchange Server is running, add or modify the following registry sub keys.

Operating System Type	Registry Path	Sub key	Type	Description
32-bit/64-bit	HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\SecurityProviders\Schannel\Protocols\TLS 1.1\Client	DisabledByDefault	dword	Set this sub key value to 0.
32-bit/64-bit	HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\SecurityProviders\Schannel\Protocols\TLS 1.1\Client	Enabled	dword	Set this sub key value to 1.
32-bit/64-bit	HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\SecurityProviders\Schannel\Protocols\TLS 1.1\Server	DisabledByDefault	dword	Set this sub key value to 0.
32-bit/64-bit	HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\SecurityProviders\Schannel\Protocols\TLS 1.1\Server	Enabled	dword	Set this sub key value to 1.

To enable TLS v1.2 on a computer where Microsoft Exchange Server is running, add or modify the following registry sub keys.

Operating System Type	Registry Path	Sub key	Type	Description
32-bit/64-bit	HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\SecurityProviders\Schannel\Protocols\TLS 1.2\Client	DisabledByDefault	dword	Set this sub key value to 0.
32-bit/64-bit	HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\SecurityProviders\Schannel\Protocols\TLS 1.2\Client	Enabled	dword	Set this sub key value to 1.
32-bit/64-bit	HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\SecurityProviders\Schannel\Protocols\TLS 1.2\Server	DisabledByDefault	dword	Set this sub key value to 0.
32-bit/64-bit	HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\SecurityProviders\Schannel\Protocols\TLS 1.2\Server	Enabled	dword	Set this sub key value to 1.

Note

- Enable both server and client (Message Connector) sub keys at Exchange Server and then restart the computer.
- To support this feature on Exchange Server 2013, install the latest updates available for Exchange Server 2013. Additionally, install the [CU16](#) update. We recommend to install latest updates for all exchange servers in use.

Operation and maintenance

Message Connector provides log files that can help for troubleshooting. Log files are stored in the application / program data folder of all users. The default path is:

```
C:\ProgramData\Kofax\KIC-ED
```

Manage logs in Message Connector

To manage logs in Message Connector:

1. Start Message Connector Configuration utility from the Kofax group in the Windows Start menu.
2. Click **Advanced** to display additional configuration options.
3. Edit the settings on the **Advanced** tab.
 - The default values (TraceLevel 10 and MessageTraceSize 1) provide basic trace information (usually sufficient) without negatively impacting the performance.
 - Troubleshooting values (TraceLevel 40 and MessageTraceSize 100000) provide lot of information; these are more suitable when duplicating error situations in controlled environment.

Refer to Message Connector Help for more information about the parameters.

4. Find log files in `<path>\MC\log`
5. Click **Save** and then click **Exit and restart service**.

Manage logs in KFXConverter

The default name of the log file is KFXConverter.log. The default location is `C:\ProgramData\Kofax\KFXConverter`. The maximum log file size is 5 MB. The file is overwritten when the maximum size is reached. You can specify another log file using the command line option `-logFile <path>\<filename>`. For example `-logFile C:\temp\mylog.log`.

In Message Connector, for PDF/A normalization using **Standard** option in **PDF to PDF/A conversion engine**, conversion results are logged in StandardPDFEngine.log.

Message Connector status monitor

Message Connector provides a monitoring interface with the following main functions:

- Sending test messages

- Viewing documents in storage
- Managing failed documents
- Monitoring Message Connector status

Send test messages

Use this section to verify the functionality of the Message Connector by sending a test fax or an email. To verify both tests, send a message in a loop (Message Connector --> Message Connector). Core Worker service will then import the message to Kofax TotalAgility.

Send a test fax

1. On the Windows **Start** menu, click **Kofax > Message Connector > Message Connector Monitor**.
2. On the **Menu**, click **Test Fax**.
3. In the **Number to Dial** box, enter a number.
4. Click **Send Fax**.
The "Server returned ok!" message appears.
5. On the **Menu**, under **Outbound Status**, click **Processed** to find the sent fax.
6. Optionally, click **Inbound > Pending** and view the message, if the Kofax TotalAgility service is not running.

Send a test mail

1. On the Windows **Start** menu, click **Kofax > Message Connector > Message Connector Monitor**.
2. On the **Menu**, click **Test Mail**.
3. In the **To** box, enter an email address.
4. Click **Send Email**.
The "Server returned ok!" message appears.

Message Connector storage

Message Connector stores all messages and files received from various sources to its internal storage before they are imported to Kofax TotalAgility.

The storage is managed automatically. Files and messages that are correctly imported to Kofax TotalAgility are marked for deletion and they are removed when the storage is full. Files and messages that are not correctly imported to Kofax TotalAgility may fill the storage. See [Manage failed messages manually](#).

The storage includes multiple folders.

- Under **Inbound Status**, click **Active** to list documents that are active and have been received by Message Connector but not yet delivered to Kofax TotalAgility. When the "archive to folder" function is activated, documents remain in this folder until the archiving has been concluded.
- Under **Inbound Status**, click **Active > Failures** to list documents that have been received by Message Connector but are not delivered to Kofax TotalAgility. Documents appear in this folder only

if the Keep Failed setting is selected in configuration. When the archive to folder function is activated, documents remain in this folder until the archiving has been concluded.

Note Documents remain in this folder until they are handled manually by an operator (reactivated or deleted). If not monitored, this can cause full storage and stop processing of documents.

- Under **Inbound Status**, click **Processed** to list documents delivered to Kofax TotalAgility. If Keep Failed is cleared, this folder also contains documents that permanently failed to import to Kofax TotalAgility. Processed documents are deleted automatically from the storage when space for active messages is needed.
- Under **Inbound Status**, click **Processed > Failed** to list documents that permanently failed to import to Kofax TotalAgility (ensure that the Keep Failed setting is clear). These documents are deleted automatically from the storage when space for active documents is needed.
- Under **Outbound Status**, click **Active** to list test fax messages which are queued for sending or are currently being sent.
- Under **Outbound Status**, click **Processed** to list test fax messages which are queued for sending or are currently being sent.
- Under **Outbound Status**, click **Processed > Failed** to list test fax messages that could not be sent.

View messages in the storage

1. On the Windows **Start** menu, click **Kofax > Message Connector > Message Connector Monitor**.
2. On the **Menu**, go to any of the storage folders (**Inbound Status** or **Outbound Status**).
3. Select the message and click the **View / Save** command.
 - Email messages are available as EML files. You can view these files in Outlook Express or Windows Live Mail or any other mail client that supports EML.
You can also view EML files in Microsoft Outlook. To view an EML file in Outlook 2007, follow the instructions from Microsoft documentation available at the Microsoft website. Outlook 2010 can directly open these files.
 - Fax messages are available in multipage TIFF format. You may need a special viewer to view this format properly.

Manage failed messages manually

Use this section, to manually manage messages that could not be delivered to Kofax TotalAgility. Depending on the Keep Failed configuration in the Message Connector Configuration User Interface, problematic messages can be found in either storage folder:

- Inbound > Active > Failures
- Inbound > Processed > Failures

Reactivate messages

In particular, it is important to monitor the Inbound > Active > Failures folder, as messages in this folder can potentially fill in the entire storage. These messages can be reactivated and Kofax Message Connector will retry to import them to Kofax TotalAgility.

1. On the Windows **Start** menu, click **Kofax > Message Connector > Message Connector Monitor**.

2. On the **Menu**, under **Inbound Status**, click **Active > Failures**.
You can view the contents of a message to investigate the problem.
3. Click **View / Save**.
4. You can either reactivate the message or delete it.
A reactivated message is moved back to the "Inbound Status > Active" folder. A deleted message is moved to the "Inbound Status > Processed > Failures" folder.

Rerun messages

The "Inbound Status > Processed > Failures" folder contains messages that are already marked for deletion. When the storage gets full, these messages are lost. However, as long as they are available, you can rerun them and create a copy of the message-as if it had just arrived-in the "Inbound Status > Active" folder.

1. On the Windows **Start** menu, click **Kofax > Message Connector > Message Connector Monitor**.
2. On the **Menu**, under **Inbound Status**, click **Processed > Failures**.
3. Click **View / Save** to view the contents of a message.
You cannot delete these messages; they are already deleted. However, you can try to rerun the message. A copy of this message is created in the "Inbound Status > Active" folder.

Chapter 4

Kofax Document Converter

Normally, the document conversion takes the default document conversion settings in TotalAgility. However, in scenarios such as, the KFXConverter is not an acceptable alternative to MS Office for converting MS Office documents, you may need to modify these settings.

The Kofax Document Converter utility provides an interface to modify the default configuration settings for document conversion. See *Document Converter help*.

This utility is installed when you install Transformation Server. Make sure that you configure these settings on each Transformation Server instance separately.

Note

- You cannot modify the default parameters in Document Converter utility in an Azure environment. You can only use KFXConverter for document conversion.
- The document conversion advanced configuration using Document Converter utility has to be performed on each Transformation Server separately.

Make sure that you provide appropriate licenses for the following third party applications that may be required for Document Converter:

- Adobe Experience Manager Server
- Total HTML ConverterX
- OpenOffice.org
- Microsoft Office

Advanced configuration for document preparation

Document Converter can normalize text, HTML, OpenOffice.org, and Microsoft Office documents to PDF. The images are not normalized to PDF, but they are always imported in their original format.

When you select to normalize your message content to PDF, Kofax Document Converter actually normalize all non-PDF parts of the message to an ISO-standardized version of PDF, the PDF/A. However, Document Converter can also normalize PDF parts to PDF/A.

Note

- If "Microsoft Office" is selected as normalization tool in "MS Office and selected Open Office documents", normalization of Excel documents result in PDF documents rather than PDF/A documents.
- Do not open MS Office applications or process MS Office documents on a computer where the document conversion with MS Office is running.

1. To run the utility, on the Windows Start menu, click **Kofax>Document Converter>Document Converter Configuration**.
2. Expand the **Document Conversion** tab.
3. Select the tool for converting Microsoft Office documents.
 - If using OpenOffice.org, make sure that you have installed the necessary extension. See [Third-Party software](#).
 - If using Microsoft Office, and if the operating system is Windows Server 2008 R2, Windows Vista, or later, select the Windows user account to use for Microsoft Office DCOM automation. For initial tests and troubleshooting, use the interactive user. For production use, specify an administrator user.

Important When you use MS Office as a conversion tool, you can only convert one document on one computer at a time. This may prevent the Transformation Servers to utilize the full potential of the computers on which the Transformation Servers run. Therefore, we recommend that you create separate Transformation Server Pools for document conversion using MS Office. All other conversion activities can be processed on different Transformation Servers. For more information, see [Transformation Server Pools](#).

4. Select the tool for converting HTML documents.
5. Click **Save** and **Exit configuration**.

Configure PDF Variant

You can select one of several supported PDF variants by editing a batch file.

1. Open the following folder (assuming default installation path on a 64-bit operating system):
`C:\Program Files (x86)\Kofax\Document Converter\Scripts`
2. Edit the file `KFXConverter.bat` in a text editor.
3. Configure the type of PDF produced when converting non-PDF documents to PDF.

If you are using Kofax Converter for normalization, perform the following substeps. For any other converter, such as Microsoft Office, this setting does not modify the converted PDF type.

- a. Find the string `IF %ConvertToType%== "PDF/A" (.`
- b. Edit the line immediately below `set ConvertToType="PDF/A1B"`. The following values are supported:
 - PDF
 - PDF/A1A
 - PDF/A1B (default)
 - PDF/A2B

4. Configure the type of PDF produced when normalizing existing PDF documents.
 - a. Find the string `IF %ConvertToType%== "PDFAn" (.`
 - b. Edit the line immediately below `set ConvertToType="PDFA1BN"`. The following values are supported:
 - PDF (disables PDF normalization)
 - PDFA1AN
 - PDFA1BN (default)
 - PDFA2BN
5. Save and close the file.

Configure Microsoft Office

To use Microsoft Office for document normalization, verify the following:

- Install a supported version of Microsoft Office on the same computer as Document Converter.
- Install at least one printer (required for Microsoft Excel document conversion).
- Start all applications (Word, Excel, and PowerPoint) at least once and respond to the initial prompts.
- If using 64-bit version of Microsoft Office, create the following folder:

```
C:\Windows\System32\config\systemprofile\Desktop
```

Configure OpenOffice.org extension

Kofax Document Converter supports the normalization of Microsoft Office documents using Microsoft Office or OpenOffice.org.

In case of using OpenOffice.org, you must install the OpenOffice.org extension on the same computer as Document Converter.

To install this extension, do the following:

1. Install a supported version of OpenOffice.org. See [Third-Party software](#) for supported versions.
2. Shut down all OpenOffice.org processes (including Quickstarter).
3. From the installation media, browse to `TotalAgility\KIC\Export\MC\OpenOfficeExtension` and run `setup.exe`.
4. Click **Browse**. Windows explorer displays the content of the installation folder.
5. Go to `MC\OpenOfficeExtension` and run `Install.bat`.
6. Wait until the extension is installed.

You can manage installed OpenOffice.org extensions by selecting **Tools > Extension Manager** from any OpenOffice.org application menu. The extension list should include "Kofax Conversion for OpenOffice 1.0.". An installed extension displays the symbol  indicating that this extension is installed for all users.

Configure Total HTML ConverterX

You can use Total HTML ConverterX for converting HTML documents, such as email messages in HTML format.

Install Total HTML ConverterX on the same computer as Document Converter. Use the default installation path.

Note For initial testing, you can use the trial version of Total HTML ConverterX.

Configure Kofax Converter

Configure the advanced settings of the Kofax Converter (KfxConverter) by editing the KFXConverter.ini file in a text editor. The ini file is located in the same folder as the Kofax Converter executable. The default location is:

```
C:\Program Files (x86)\Kofax\Document Converter\bin\KFXConverter..
```

Document Converter installs the KFXConverter_Default.ini file to the same folder. If the KFXConverter.ini does not exist when Document Converter starts, a copy of KFXConverter_Default.ini is created. On upgrade, an existing KFXConverter.ini is not modified by the setup.

Refer to the following table for the parameters available in KFXConverter_Default.ini.

Note

- You cannot modify the default parameters in KFXConverter.ini file in an Azure environment.
- Fix the line breaks if you copy and paste the code from this guide.

Group	Parameter name	Default value	Description
EML2PDF	EnableMargin	False	If set to True, KfxConverter considers the margin parameters and the parameter PgNmDistFromHeader.
	LeftMargin	3.175 cm	Left margin of page (in centimeters).
	RightMargin	3.175 cm	Right margin of page (in centimeters).
	TopMargin	2.54 cm	Top margin of page (in centimeters).
	BottomMargin	2.54 cm	Bottom margin of page (in centimeters).
	PgNmDistFromHeader	1.3 cm	Page number distance from header (in centimeters).
	EnableFontSize	False	If set to True, KfxConverter considers the "FontSize" parameter, and all the converted PDF files will be of the same font size.
	FontSize	12	Font size in points.

Group	Parameter name	Default value	Description
	DateFormat		<p>Defines the date format. If empty, the default date format is used. Examples:</p> <ul style="list-style-type: none"> DateFormat="dd-MMM-yy" DateFormat="yyyy-MM-dd" <p>For more information, see http://msdn.microsoft.com/en-us/library/8kb3ddd4(v=vs.110).aspx</p> <p>Note Depending on the regional settings of your operating system, certain separators are not available. For example, a forward slash configured in the ini file might be replaced with a hyphen as date separator.</p>
	FitTableWidthToPage	True	KFXConverter resizes the table width based on the page size in output PDF files when converting EML files (including body with message header).
	ResizeLargeImages	2	<p>Resize the images that are larger in size. The following options are available:</p> <p>0 - Image is not resized.</p> <p>1 - The image size is compared with the section size of the document. If the image size is larger than the section size, image is resized to fit the section.</p> <p>2 - Free space is calculated based on whether an image is inline or floating. The image resize ratio to fit the page size is calculated as per the longer side of the image, and then the image is resized.</p> <p>Note If ResizeLargeImages is set to 0 when the input file contains large size images, file conversion may result in data loss.</p>
PDF2PDF	ALCWebServiceTimeout	1200 sec	Adobe Experience Manager web service timeout in seconds.
TEXT2PDF	FontType	Arial Unicode MS	Specifies the font type for the generated PDF. The font must be installed on the computer on which KFXConverter is used.
EXCEL2PDF	FitAllColumnsToOnePage	True	If set to True, all the columns are set to one page.
	PaperOrientation	-1	Defines the paper orientation. Default is -1, for Landscape 0, for Portrait 1
	PaperSize	Default	Disables the papersize setting.

Group	Parameter name	Default value	Description
	ConvertSheets	All	<p>KFXConverter converts the pages according to the values specified in field. Possible values are: All, Active, 1, 2, 3 and so on. Specify the values as comma separated values.</p> <p>For example, ConvertSheets=Active, 1 converts the first page and the active page, whereas ConvertSheets=All converts all the pages.</p> <div style="border: 1px solid black; padding: 5px; background-color: #f0f0f0;"> <p>Note If a blank page is selected for conversion and no printable area is selected in excel, KFXConverter ignores this page at the time of conversion. But, if a blank page with defined printable area is selected for conversion, KFXConverter converts this page into pdf.</p> </div>
	EnableMargin	False	If set to True, KFXConverter considers the margin parameters.
	LeftMargin	1	Left margin of page (in centimeters).
	RightMargin	1	Right margin of page (in centimeters).
	TopMargin	1	Top margin of page (in centimeters).
	BottomMargin	1	Bottom margin of page (in centimeters).
HTML2PDF	EnableMargin	False	If set to True, KFXConverter considers the margin parameters.
	LeftMargin	0.3528 cm	Left margin of page (in centimeters).
	RightMargin	0.3528 cm	Right margin of page (in centimeters).
	TopMargin	2.54 cm	Top margin of page (in centimeters).
	BottomMargin	2.54 cm	Bottom margin of page (in centimeters).
MHT2PDF	EnableMargin	False	If set to True, KFXConverter considers the margin parameters.
	LeftMargin	3.175 cm	Left margin of page (in centimeters).
	RightMargin	3.175 cm	Right margin of page (in centimeters).
	TopMargin	2.54 cm	Top margin of page (in centimeters).
	BottomMargin	2.54 cm	Bottom margin of page (in centimeters).
EXTERNAL RESOURCE LOADING	LoadExternalResources	True	If set to False, when converting EML or MSG documents, KFXConverter does not download any externally linked resource, such as, an image from an internet hyperlink.
GENERAL	OriginalDocumentFolder		If document conversion fails and path is valid, original file is saved at this path.
	EnablePageHeader	True	If set to false, KFXConverter disables the page number displayed on top of each page.

Group	Parameter name	Default value	Description
	EncodingType	UTF-8	<p>If encoding type is defined in the input files, KFXConverter uses the same for converting the documents; otherwise, the default encoding type or the value specified for the EncodingType parameter is used.</p> <p>The encoding type is only applicable for HTML, MHT and EML file formats.</p>

Group	Parameter name	Default value	Description																						
PDF2PDF/A	AllowedErrors	0	<p>If the Standard option is selected in PDF to PDF/A conversion engine field in Document Converter, the KFXConverter allows the document conversion with the specific conversion errors.</p> <p>To ignore one or more conversion errors and allow conversion, set the value of AllowedErrors to one error code or to a combination of error codes.</p> <p>If AllowedErrors=0, no error is allowed. All the error codes and all possible values generating from an OR operation of the error codes can be used to ignore one or more document conversion errors.</p> <p>The following table lists the error codes and description.</p> <table border="1"> <thead> <tr> <th>Error code</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>4</td> <td>Visual differences</td> </tr> <tr> <td>8</td> <td>Name collisions of colorants</td> </tr> <tr> <td>16</td> <td>Removing optional content groups (layers)</td> </tr> <tr> <td>32</td> <td>Removing transparency</td> </tr> <tr> <td>64</td> <td>Removing embedded files</td> </tr> <tr> <td>128</td> <td>Removing non-convertible XMP metadata</td> </tr> <tr> <td>512</td> <td>Removing of signatures while normalizing the signed document</td> </tr> <tr> <td>4096</td> <td>Normalizing corrupt input document</td> </tr> <tr> <td>16384</td> <td>Similar font substitution</td> </tr> <tr> <td>32768</td> <td>Removing interactive elements such as actions or annotations</td> </tr> </tbody> </table> <p>Examples:</p> <ul style="list-style-type: none"> • If AllowedErrors = 4, visual differences in the output file do not cause a document conversion error. • If AllowedErrors = 132, that is, combination of error code 4 and error code128, conversion is done even if there are visual differences in the output file, or non-convertible XMP metadata is removed. 	Error code	Description	4	Visual differences	8	Name collisions of colorants	16	Removing optional content groups (layers)	32	Removing transparency	64	Removing embedded files	128	Removing non-convertible XMP metadata	512	Removing of signatures while normalizing the signed document	4096	Normalizing corrupt input document	16384	Similar font substitution	32768	Removing interactive elements such as actions or annotations
Error code	Description																								
4	Visual differences																								
8	Name collisions of colorants																								
16	Removing optional content groups (layers)

16384	Similar font substitution																								
32768	Removing interactive elements such as actions or annotations																								

Flatten XFA files

You can import and flatten the PDF documents with Adobe XML Forms Architecture (XFA forms) using the Document Converter. To achieve this, you must install Adobe Experience Manager Server and make it accessible to TotalAgility.

Note If support for Adobe LiveCycle is available, you can also use Adobe LiveCycle for conversion of XFA Forms.

Prerequisites for using the Adobe Experience Manager Server:

- Install the Adobe Experience Manager software on a different computer than TotalAgility. However, to decrease the probability of timeouts and retries, we recommend that you install the software in the same network LAN segment.
- Ensure that the Output service is running, and its web service is enabled and working.
- The minimum supported version of Adobe Experience Manager Server is ES3.

Note

- Any limitations imposed by Adobe are applicable. For example, only XFA PDFs with no rights, signature, or certification can be converted to PDF or PDF/A. See Adobe Experience Manager documentation for more information.
- When an exception occurs while using Adobe Experience Manager, TotalAgility reports the exception in its log file, and the error is treated as a standard document conversion error.

To configure the Adobe Experience Manager Server, do the following:

- In Document Converter, specify the information for connecting to Adobe Experience Manager Server on the **Adobe Experience Manager** tab.
- In the System Setting module of TotalAgility Designer, enable the **Flatten XFA forms to PDF/A Documents Using Adobe Experience Manager** setting when configuring the document conversion profiles.

Note

- Enabling this setting may have impact on the performance as each PDF document is sent to Kofax converter to determine whether it is XFA form or standard PDF.
- For more information on the document conversion profiles, see the *TotalAgility help*.

Image normalization rules

The following rules apply at the time of handling the resolution and dimension in image normalization process. The first matching rule governs the conversion.

1. If the resolution of an incoming image matches the requested resolution, the image is not changed.

2. If the value of `MaxPrintSize` parameter is set to a non zero value, re-sampling is skipped for files with size more than `MaxPrintSize`. This parameter is available in the `image2tif.bat` script file. The default location of the file is:
`C:\Program Files (x86)\Kofax\KIC-ED\MC\Scripts`. By default, `MaxPrintSize` is set to 0.
3. If the x and y resolutions are different, the image is re-sampled to the requested resolution (non-quadratic pixel case).
4. If the resolution value is wrong, it is set to a requested value without re-sampling the image. This changes the printing size of the image. To avoid quality loss, such images are not re-sampled. A resolution is wrong if one of the following conditions is true:
 - The resolution is below the `MindxResolution` value which is set to 96 dpi. If the `MindxResolution` is not set, ImageMagick returns 72 dpi.
 - The resolution exceeds 200 dpi and the width is less than 1500 pixel (19.5cm@200dpi).
 - The resolution exceeds 200 dpi and the height is less than 2000 pixel (25.4cm@200dpi).
5. If the resolution is higher than the requested resolution, the image is down-sampled to the requested resolution.
6. If none of the above listed rules applies, the image conversion depends on the configuration in the script file `image2tif.bat`. Open the file with a text editor and change the value in the line `Set ResetResolution=0`. The following values are available:
 - 0: Resample image and change resolution. This is the default option. Image file size is increased without improving the image quality. Re-sampling is a time-consuming operation that results in lower performance.
 - 1: Change the resolution without re-sampling. This reduces the print size of the image.
 - 2: Image is not changed. Set this value for best performance.

Manage conversion time for large files

To process some large size files, the default configured time may be less. In such scenarios, to avoid timeout, you can increase the default conversion time.

To increase the timeout value, do the following:

1. Open the `Create_Config.xslt` file from `C:\Program Files (x86)\Kofax\KIC-ED\MC\xcd` (default installation path).
2. Increase the value of the `<MaxTimeout>` parameter under `<ConversionOptions>`.
3. If the `<MaxTimeout>` or `<ConversionOptions>` parameters are not available, add these parameters under `<TncDocConv>` as shown in the following example.

```
<TncDocConv>
    ...
    <ConversionOptions>
        <MaxTimeout>1200000</MaxTimeout>
    </ConversionOptions>
    ...
</TncDocConv>
```

4. Save and close `Create_Config.xslt`.
5. Restart Document Converter.

Supported formats for document conversion

TotalAgility support the following document formats for conversion with various third-party tools.

Note You cannot use MS Office, Open Office, Total HTML Converter in an Azure environment.

Document formats	Microsoft Office	OpenOffice.org	Total HTML ConverterX	Tools embedded in Document Converter	KFXConverter
Word documents (doc, docx, dot, dotm, dotx and docm) ^{1,9}	Yes	Yes (doc and docx formats only)		Yes	Yes
Excel documents (xls,xlsx, xlm, xlt, xlsx, xltx, xltm, xlsb, xlam and csv) ^{1,9}	Yes	Yes (xls and xlsx formats only)		Yes	Yes
PowerPoint documents (ppt, pptx, pot, pptm, potx, potm, pps, ppsx, ppsm, sldx and sldm) ^{1,4,9}	Yes	Yes (ppt and pptx formats only)		Yes	Yes
Text documents (both attachments and email body) (txt, log, rtf and xps)	Yes	Yes		Yes	Yes
OpenOffice documents (odp, otp, sti, sxi, odg, otg, std, sxd, odt, ott, stw, sxw, ods, ots, stc and sxc)		Yes			Yes (odt, ods and odp formats only)
HTML, MHT, HTM, MHTML documents (both attachments and email body)	Yes		Yes	Yes	Yes
EML documents (email header embedded on the first page of email body) ⁷				Yes	Yes
MSG documents ^{5,7}				Yes	Yes
PST files ⁶				Yes	Yes
Images (bmp, gif, jpg, jpeg, png, tif and tiff) ²				Yes	Yes

Document formats	Microsoft Office	OpenOffice.org	Total HTML ConverterX	Tools embedded in Document Converter	KFXConverter
PDF documents (including portfolio PDFs and XFA) ^{1, 3}				Yes	Yes
compressed documents (zip, rar, 7z, tar and gz)				Yes	Yes
XML documents ⁸				Yes	
XML Paper Specification (xps) ⁹					Yes

1. Conversion of password-protected documents is not supported.
2. Images can be converted to the 200x200 DPI or 300x300 DPI resolutions; black & white, grayscale, or color.
3. Conversion of PDF documents with XFA forms (Adobe XML Forms Architecture) created with Adobe Experience Manager Designer requires Adobe Experience Manager environment via network.
4. Conversion of PowerPoint documents with the extension .ppsx is not supported via OpenOffice.org.
5. MSG documents where attachments are removed by any Microsoft Outlook archiving function are not supported and they are treated as document conversion errors.
6. Require additional manual steps. See [Import PST files](#).
7. For folder import only, EML and MSG files are treated as if the messages have arrived via email. The metadata of the message (and not the metadata of the file) is used.
8. Conversion might require third-party tools during configuration or customization. The tools are not required during operation.
9. KFXConverter supports conversion of Microsoft Office 2003 to Microsoft Office 2016 and Microsoft Office 365 documents. It also supports the conversion of XPS format.

Note Each conversion tool produces the desired output in a different way. As a result, switching to another conversion tool may change the look of your converted documents.

Supported input file formats and output PDF formats

See [Supported input file formats and output PDF formats](#) .

Chapter 5

Assign access permissions to different areas of TotalAgility

The following table lists the default full control access permissions for different areas of TotalAgility.

Process	Designers
Business Rule	Designers
Resource	Designers
Settings	Administrators
Work Type	Designers
Lock Status Search	Designers
Job Clear Down	Administrators
Capture	Designers
Persona	Designers
Designer	Designers
Devices	Device Users
Capture Design	Designers

Chapter 6

Log on to TotalAgility in a recovery mode

To log on to TotalAgility in a recovery mode, you should have full control or read write permissions. Alternatively, you can log on to TotalAgility in a recovery mode by using the recovery mode session ID.

To obtain or update the recovery mode session ID:

1. Run the configuration utility from your installed location.

Note The configuration utility is available on the installation media and must be manually copied to your Kofax TotalAgility server.

2. On the **App** settings tab, locate the `RecoveryModeSessionId` key.
By default, the key has a session ID that can be used to logon. You can change the session ID as required.
3. Enter the recovery mode URL. See *Configure the federated security* in the *TotalAgility help* for more information.
4. Enter the **Recovery mode session ID** located from the **App** settings tab and click **Validate**.
The Recovery mode page appears.
5. Enter the **Username** and **Password**.
6. Click **Login**.
The TotalAgility Designer is launched in the recovery mode.

Appendix A

Active Directory synchronization

Kofax supports the following features in Active Directory synchronization.

Partitioned Active Directory

- To easily access and efficiently manage data.
- To better distribute load (load balancing).
- To reduce search and update costs.

Active Directory domains

A domain is a group of computers that share a common directory database.

A domain name must be unique. For example, you cannot have two kofax.com domains, but you could have a kofax.com parent domain with irvine.kofax.com and bedford.kofax.com child domains.

Each domain has its own security policies and trust relationships with other domains.

Domains can span more than one physical location, which means a domain could consist of multiple sites and those sites could have multiple subnets.

A domain directory database consists of objects defining accounts for users, groups, and computers as well as shared resources, such as printers and folders.

An Active Directory service provides both logical and physical structures for network components.

Network setup

A typical network setup consists of the following structures:

- **Physical:** These include:
 - Subnets: A network group with a specific IP address range and network mask.
 - Sites: One or more subnets used to configure directory access and replication.

- **Logical:** These include:
 - Domains: A group of computers that share a common directory database.
 - Domain trees: One or more domains that share a contiguous namespace.
 - Domain forests: One or more domain trees that share common directory information.
 - Organization units: A subgroup of domains that often mirrors the business or functional structure of the company.

Child domain

Parent domains can be divided into sub-domains which are also called child domains. For example, the host name for a computer in Irvine office could be abc.irvine.kofax.com where abc is the computer name, Irvine is the child domain and kofax.com is the parent domain. These domains in turn can have subdomains.

Additional domain (Cross domain)

Each Active Directory domain has a DNS domain name, such as kofax.com. When one or more domains share the same directory data, they are referred to as a forest. In the DNS naming hierarchy, a domain name within a forest can be:

- Contiguous (child domain)
- Discontiguous: They form separate domain trees within the forest. In this example, the msnbc.com and microsoft.com domains form the roots of separate domain trees in the same forest.

Forests and trees

Windows .NET and 2000 domains can be grouped into trees and forests.

The directory is structured like a tree of domains that collect Naming Contexts containing Active Directory data; each domain can include one or more DCs (replica DCs). From a system engineer's point of view, a tree is a collection of domains in one-way /two-way transitive or non-transitive trust, consequently the attention is focused on authentication and extension of the domain's physical boundaries.

However this topology also has a specific meaning with respect to LDAP: identification of a directory object is related to its position inside the tree and this dictates how to create a correct LDAP string for accessing and managing directory objects. If we can have multiple domain trees in an organization's directory, there must be some overall grouping. This grouping is called forest.

While two domain trees in the same forest do not share a DNS namespace, they must share the same schema and global catalogue. When you join domain trees, a trust relationship establishes between the root domains of each tree in a similar way when you join individual domains into domain trees.

LDAP (Lightweight Directory Access Protocol)

LDAP, Lightweight Directory Access Protocol, is an Internet protocol that email and other programs use to look up information from a server.

You can retrieve AD's information through some access points (services), called providers. These providers use different interaction protocols or correspond to different LDAP protocol:

- LDAP: Compatible with Lightweight Directory Access Protocol
- GC: Compatible with LDAP, connection request is specified with a Global Catalog server
- WinNT: Compatible with Windows NT/2000/XP/.NET systems
- NDS: Compatible with Novell NetWare Directory Service
- NWCOMPAT: Compatible with Novell NetWare 3.x implementations

Kofax TotalAgility uses the LDAP protocol that represents the protocol for .NET/2000 domains. LDAP allows creating, deleting and moving of an object, listing of a container's content, and so on.

The LDAP protocol lets you retrieve information related to objects contained in an AD using a specific syntax. This syntax allows searching for directory objects and selecting them on the basis of their attributes.

LDAP query

A well-formed LDAP query is an application message made up of a set of parameters that lead to the following search criteria:

- Search base (or base object): It defines the basic location, that is, the forest node or leaf, where the search must start; the location is defined by using an LDAP distinguished name. Search base is used to indicate the directory section where the search should take place.
- Scope: It specifies how deep the search should go. There are three kinds of scopes:
 - Base: Restricts the search to the search base; if, for instance, the search base is a container object, its attributes will be listed, but not its contents.
 - One level: Takes the search just beyond the base object, excluding the base object itself.
 - Subtree: Extends the search over the whole subdirectory (including the base object). A Filter is used to single out the required elements in the specified tree section.
- Selection (or attribute description list): It determines which attributes of the selected objects are important.

Paged search

Paging specifies how many rows at a time the server returns to the client. A page can be defined by the number of rows or a time limit. The ADSI COM object retrieves each page of results based on the following settings:

- ADS_SEARCHPREF_PAGESIZE: Specifies the number of rows to return in a page.
- ADS_SEARCHPREF_PAGED_TIME_LIMIT: Specifies the maximum time (in seconds) that the server should spend collecting a page of results before returning the page to the client. If the limit is reached, the server stops searching and returns the rows retrieved for the page up to that point.

If neither of search preferences is set, the default is no paging.

A search operation may return a big chunk of objects. This could downgrade the performance of the client and server as well as the network load. The Paged search can be used to prevent this. In a paged search, the client may select to accept results in smaller chunks. The size of a chunk is known as the search page size.

Referral chasing

A referral is the mechanism that a directory server uses to direct a client to another server when it does not contain sufficient information about the object(s) requested by a query.

In a one-level or subtree, referrals are returned for known, immediately subordinate domain, schema or configuration containers only (that is, child domains that are direct descendants).

In a directory, not all information is available on a single server; it is distributed over several different servers across the network. If the servers share the information that other servers provide, they can provide referrals to a client when a requested query cannot be resolved on the originating server. For example, when a client asks **Server A** to query a user object (U), then A can suggest that the client continue the search on **Server B** if U does not reside on A, but is known to be on B. The client has the choice to use the referral or not.

Search referrals free the client from possessing previous knowledge of the capability of each server. But the client must specify the type of referrals a server should make.

To enable referral chasing, use the ADS_SEARCHPREF_CHASE_REFERRALS preference with values from the ADS_CHASE_REFERRALS_ENUM enumeration.

Types of referral chasing

A client can choose any of the following four types of referral chasing:

- **Never:** The server does not generate a referral to a client even though it knows that another server holds the requested information. This is the default setting.
- **External:** The server generates referrals if the request can be resolved on another server of a different directory tree. For example, a client queries OU=Sales, DC=Microsoft, DC=COM on the msft01 server on the Microsoft.com domain. However, the object does not belong to msft01, but is known to be on the arc01 server on the Microsoft.com domain. Thus, msft01 will refer arc01 to the client.
- **Always:** The server generates referrals if the search can be resolved based on either the external type or the subordinate type.
- **Subordinate:** The server generates referrals if the request can be resolved on a server whose name forms a contiguous path from the originating server. The search scope must be at the subtree level.

Syntax of filter

```
([<operator>] (<filter>) [(<filter>) ...])
```

Where,

```
<filter> = (<attribute><operator><value>)
```

<attribute> is the attribute of an object

<operator> is one of the values listed in the following table

<value> is a value compatible with the attribute type

Operator	Description	Type it applies to
&	logic And	<filter>
!	logic Or	<filter>
"="	Equality	<attribute>
>=	Greater Or Equal	<attribute>
<=	Less Or Equal	<attribute>
~=	Approximately Equal to	<attribute>
*		

For example, `&(objectCategory=person)(uSNChanged>100)!((CN='Test')(CN='Test1'))`

Active Directory attributes

- ou (organizationalUnit)
- sAMAccountName
- cn
- dc (domainDNS)
- distinguishedName
- objectCategory
- objectClass
- objectGUID
- objectSid
- SID=S-1-5-21-3917318313-2927010959-1265295254-2115

Implement Active Directory synchronization

TotalAgility Active Directory synchronization is passive. It cannot add, update or delete anything in Active Directory. As an added security measure it obfuscates the Object ID from Active Directory to store it as a Resource ID in TotalAgility (HEX conversion). It is not possible to locate the same resource in Active Directory even from the Resource ID from TotalAgility.

Synchronize active items

1. Create List of OUs.
2. Create List of Users in OU.
3. Create List of Groups in OU.
4. Get changed Users and Groups in the system.
5. Set the value of server variable, `sAD_CHASE_REFERRAL` to turn on or off referral chasing.
 - True: To enumerate resources from parent and external domains/forest.
 - False: To enumerate resource from parent and child domains.

6. To enumerate child and additional domain resources the "DC" string is modified based on resource's path where same server name is used for search.
7. To enumerate cross forest resources, account and domain information is retrieved from SID and LDAP query is rebuilt to point to new server.

Synchronize deleted items

TotalAgility supports delete synchronization for users, groups and categories.

To synchronize deleted items, set isDeleted=TRUE.

- AD server should be configured to add deleted resources to Delete container then only this feature will work.
- If resource is deleted from AD will be deleted from TotalAgility during delete synchronization only if resource is not in use.

Synchronize root level

- All the OUs and resources in AD server will be imported to TotalAgility.
- First synchronization will take more time, from next sync only newly added\deleted resources will be synchronized.
- The resources from User container will not be imported as they are not part of any OU. This is to restrict unwanted resources' import like computer, printer, domain controller and the rest.

Synchronize middle level

- Resources will be imported from specified OU and its children OUs.
- If target OU has parent OU then complete path should be specified for target OU (Test OU). For example, SERVER_NAME/OU=Test Parent, OU=Test OU

Note The resources from Test parent will not be imported as target OU is Test OU.

- The resources from User container will not be imported as they are not part of any OU; the only exception is when group search is specified.

Perform group search

- Specified group and its members will be imported to TotalAgility.
- Option is available only for group and not for user search.
- For root level sync, group is searched in complete AD server.
- For mid-level sync, group is searched in specified OU and its children OUs.
- Only for Group search, resources from User container will be imported to TotalAgility in default category.

Synchronize cross domains

Group members residing in different domains or forests can also be imported to TotalAgility.

- Domain should be fully trusted or at least have trust to allow LDAP search.

- Child Domain Sync: Regardless of Chase referral flag resources will always be imported.
- Sub domain Sync: Chase referral should be true to import resources.
- External Forest Sync: Chase referral should be true to import resources

Synchronize category within category

The OU structure in AD can be imported as is in TotalAgility.

- If category name length is more than allowed in TotalAgility or category with same name already exist in TotalAgility or any other database constraint, category will not be imported and error will be logged with exact cause. Resources to invalid category will be added to the default category.
- For example, if synchronizing Group "G1" which is in OU1 and some members of G1 are in different OUs and that OUs are not in current search path (that is, with mid level synchronization).
 - All the parent OUs for OU1 will be imported. For example, OU1- > Parent of OU1-> Parent of (Parent of OU1).

Note Only parent OUs will be synchronized not the resources inside those OUs.

- Group Members from different OUs that are not direct\indirect children of target OU will be imported only if chase referral is true.
- If members are imported then their parent OUs till root level will be imported same as point 1.

Synchronize groups within groups

The Group structure in AD can be imported as is in TotalAgility.

- Circular group synchronization is supported even within external domains. (such designs should be avoided)
- Groups within groups in cross domain is supported, that is, parent group in one forest and members are in child domain, sub domain or forest.
- If group or user name length is more than allowed in TotalAgility or any other database constraint, resource will not be imported and error will be logged with exact cause.
- The complete group structure from AD is retrieved in multiple parses through recursive call to LDAP Query. Each call to LDAP query returns single level group information and if group has subgroups then new query is fired on subgroup to retrieve its children and does until it finds the leaf node or circular group.

Implement chase referral

- The referral chasing will be turned on or off based on the value of server variable sAD_CHASE_REFERRAL.
- If it is on, resources from parent and external domains/forest will be enumerated, otherwise resource from parent and child domains will be enumerated.
- To enumerate child and additional domain resources, the "DC" string will be modified based on resource's path whereas same server name will be used for search.
- To enumerate cross forest resources, account and domain information will be retrieved from SID, and LDAP query will be rebuilt to point to new server.

Appendix B

Lock activity performance

If you decide to lock activities based on job expected finish time, you can improve the performance of TotalAgility by creating a new index on the LIVE_ACTIVITY table.

To create this index, run `Create_Job_Expected_Finish_Time_Index.sql` available at:

```
$:\Program Files\Kofax\TotalAgility\DatabaseScripts\SQL Server
```

This file gets installed with the other TotalAgility SQL scripts during the TotalAgility installation but the index SQL is not executed during installation. You must run it manually if you want to apply the index.

You can lock activities based on job expected finish time by changing the value of the appSetting "CoreWorkerActivityOrder" in the Core Worker service or Transformation Server config files.

The supported values for CoreWorkerActivityOrder are:

ActivityPriority = 0

ActivityDueDate = 1

ActivityPriorityDueDate = 2

ActivityDueDatePriority = 3

JobPriority = 4

JobDueDate = 5

JobPriorityDueDate = 6

JobDueDatePriority = 7

The new index improves performance if the value of CoreWorkerActivityOrder is 5 or 7.

Appendix C

CoreWorkerActivityOrder setting

By default, the CoreWorker service retrieves processed automatic activities in the order of activity due date and priority. However, you can change the order of the activities by running the configuration utility.

Note The configuration utility is available on the installation media and must be manually copied to your Kofax TotalAgility server.

The possible values are as follows.

Value for Activity/Job	Description
0 (Activity Priority)	Process activities based on activity priority.
1 (ActivityDueDate)	Process activities based on activity due date.
2 (ActivityPriorityDueDate)	Process activities in the order of activity priority and activity due date.
3 (ActivityDueDatePriority)	Process activities in the order of activity due date and activity priority. (This is the default setting.)
4 (JobPriority)	Process jobs based on job priority.
5 (JobDueDate)	Process jobs based on job due date.
6 (JobPriorityDueDate)	Process jobs in the order of job priority and job due date.
7 (JobDueDatePriority)	Process jobs in the order of job due date and job priority.

1. Run the configuration utility from your installed location.
2. On the **Core Worker** settings tab, change the value for `CoreWorkerActivityOrder` as required.
3. Click **Save**.

Appendix D

Cross Origin Resource Sharing setting

Cross Origin Resource Sharing (CORS) in Kofax TotalAgility allows other domains to access the Kofax TotalAgility SDK APIs.

The `CorsAllowedOrigins` setting determines the origin or domains that can access the web server. You can enable CORS by running the configuration utility post installation.

Note The configuration utility is available on the installation media and must be manually copied to your Kofax TotalAgility server.

1. Run the configuration utility from your installed location.
2. On the **Web** settings tab, enter the value for `CorsAllowedOrigins` as follows.
 - To access two different domains using CORS, such as `CompName1.domain1.com` and `CompName2.domain2`, configure the value as follows:

```
http://CompName2.domain2,http://CompName1.subdomain1.domain1.com
```

Note Separate the two domains by a comma.

- To access all the origin or domains, use the following value: *
 - To disable CORS (default), do not enter any value.
3. **Save** the file.

Appendix E

Logging

Logging is used to record critical errors, such as database failures. All errors are written into the Windows Event log. This includes errors which occur in the services, and errors that occur when an SDK web service call is invoked.

TotalAgility uses the Unity logging framework which enables enhanced logging, through various configuration settings. The settings for logging are present but commented out in the configuration files. You can enable these settings to write logging to the configured files. The Unity logging framework allows configuration of logging output from a list of supported destinations.

You can enable Unity logging for the following server and services:

- Web Server
- Core Worker, Export Service, Streaming Service
- Transformation Server
- Reporting Server

You can configure logging to use different outputs, such as event log and log file. (Default: event log)

TotalAgility Web and Application Server

This section describes error logging configuration for the TotalAgility Application server.

Logging can be enabled in the following configuration files:

- Web.config
- Agility.Server.Core.WorkerService.exe.config
- Agility.Server.StreamingService.exe.config
- Agility.Server.Core.ExportService.exe.config

```
<loggingConfiguration name=""

</exceptionHandling>
```

This section describes the configuration to trace out calls to TotalAgility. To output tracing, you must update the relevant CONFIG file. If tracing web server calls, edit Web.config.

- To output tracing Logger.Log() or Logger.LogMessage() calls in TotalAgility to a text file, update the relevant CONFIG file with the following:

```
....
<trace autoflush="true">
  <listeners>
    <add name="Log" type="System.Diagnostics.TextWriterTraceListener" initializeData="c:\temp\Trace.txt">
    </add>
  </listeners>
</trace>
....
```

For more information, see [Logging](#).

- To output tracing about all calls being made through Unity dependency injection to a text file, update the CONFIG file with the following changes in addition to the above changes:

```
....
<unity xmlns="http://schemas.microsoft.com/practices/2010/unity">
<container>
  <extension type="Agility.Server.Common.Logging.LogMethodRegistration,
  Agility.Server.Common, Version=1.0.0.0, Culture=neutral, PublicKeyToken=d86c87abe4a71948" />
....
```

TotalAgility Transformation Server

This section provides logging diagnostic information for the TotalAgility Transformation Server. The logging configuration is stored in `Kofax.CEBPM.CPUServer.ServiceHost.exe.config`.

By default, the Transformation Server configuration file is located in the temporary folder. To save the log file in another location, such as `C:\logs\TS_Log`, do the following:

1. Stop the Kofax Transformation Server service.
2. Open "Kofax.CEBPM.CPUServer.ServiceHost.exe.config" in text editor.
3. Search for "CPUServerLogTxt" and modify the section after initializeData to the path you wish to save the log file. Example:

```
<add name="CPUServerLogTxt"
  type="Kofax.CEBPM.CPUServer.Common.Diagnostics.DateTimeTaggedTraceListener,
  Kofax.CEBPM.CPUServer.Common" initializeData="C:\logs\TS_Log\KofaxCPUServerLog.log" >
<filter type="System.Diagnostics.EventTypeFilter" initializeData="All"/> </add>
```

4. Restart the Kofax Transformation Server service and verify that the updated log file is written to the new directory.

You can configure logging to use different outputs, such as event log and log file. In the application configuration file, you can also specify the logging options.

Example: Log errors into the application event log

This example defines a simple logging configuration where all errors log into the application event log so they can be viewed using the Event Viewer utility.

It includes:

TraceLevelSwitch: This trace switch with a value "Verbose" traces verbose, information, warning and error messages. This switch is used for all Transformation Server modules. See the `switchName` attribute of the `<source>` tag.

initializeData="Error": This attribute specifies the tracing level in the trace listener.

```
<system.diagnostics>
  <trace autoflush="true" />
  <switches>
    <!--
      Off - None
      Error - Only error messages.
      Warning - Warning messages and error message.
      Information - Informational messages, warning messages and error messages.
      Verbose - Verbose messages, informational messages, warning messages and error
messages.
      All - All messages.
    -->
    <add name="TraceLevelSwitch" value="Verbose"/>
  </switches>
  <sources>
    <source name="Kofax.CEBPM.CPUserver.ServiceHost" switchName="TraceLevelSwitch" >
      <listeners>
        <clear />
        <add name="EventLogListener" />
      </listeners>
    </source>
    <source name="Kofax.CEBPM.CPUserver.Core" switchName="TraceLevelSwitch" >
      <listeners>
        <clear />
        <add name="EventLogListener" />
      </listeners>
    </source>
    <source name="Kofax.CEBPM.CPUserver.Common" switchName="TraceLevelSwitch" >
      <listeners>
        <clear />
        <add name="EventLogListener" />
      </listeners>
    </source>
    <source name="Kofax.CEBPM.DataLayer" switchName="TraceLevelSwitch" >
      <listeners>
        <clear/>
    </source>
  </sources>
  <add name="xml" type="System.Diagnostics.XmlWriterTraceListener"
  initializeData="Kofax.CEBPM.DataLayer.log"/>
  </source>
</sources>
<sharedListeners>
  <add name="EventLogListener" type="System.Diagnostics.EventLogTraceListener"
  initializeData="Application" >
    <filter type="System.Diagnostics.EventTypeFilter" initializeData="Error"/>
  </add>
</sharedListeners>
</system.diagnostics>
```

Example: Logs in different formats

This example defines the logging configuration to log all messages to the text files and errors to the event log.

To have logs in different formats you must specify the Trace Listener in the <sharedListeners> section and reference it under all necessary sources in the <source> tag.

```
<system.diagnostics>
  <trace autoflush="true" />
  <switches>
    <!--
      Off - None
      Error - Only error messages.
      Warning - Warning messages and error message.
      Information - Informational messages, warning messages and error messages.
      Verbose - Verbose messages, informational messages, warning messages and error
messages.
      All - All messages.
    -->
    <add name="TraceLevelSwitch" value="Verbose"/>
  </switches>
  <sources>
    <source name="Kofax.CEBPM.CPUServer.ServiceHost" switchName="TraceLevelSwitch" >
      <listeners>
        <clear />
        <add name="CPUServerLogTxt" />
        <add name="EventLogListener" />
      </listeners>
    </source>
    <source name="Kofax.CEBPM.CPUServer.Core" switchName="TraceLevelSwitch" >
      <listeners>
        <clear />
        <add name="CPUServerLogTxt" />
        <add name="EventLogListener" />
      </listeners>
    </source>
    <source name="Kofax.CEBPM.CPUServer.Common" switchName="TraceLevelSwitch" >
      <listeners>
        <clear />
        <add name="CPUServerLogTxt" />
        <add name="EventLogListener" />
      </listeners>
    </source>
    <source name="Kofax.CEBPM.DataLayer" switchName="TraceLevelSwitch" >
      <listeners>
        <clear/>
        <add name="xml" type="System.Diagnostics.XmlWriterTraceListener"
initializeData="Kofax.CEBPM.DataLayer.log"/>
      </listeners>
    </source>
  </sources>
  <sharedListeners>
    <add name="CPUServerLogTxt"
type="System.Diagnostics.TextWriterTraceListener" initializeData="KofaxCPUServerLog.log" >
<filter type="System.Diagnostics.EventTypeFilter" initializeData="All"/>
    </add>
    <add name="EventLogListener"
type="System.Diagnostics.EventLogTraceListener" initializeData="Application" >
<filter type="System.Diagnostics.EventTypeFilter" initializeData="Error"/>
    </add>
  </sharedListeners>
</system.diagnostics>
```

Transformation Server has its own internal trace listener, `DateTimeTaggedTraceListener` which allows to have a text log with timestamps in different formats.

Optionally, you can specify different trace switches and assign them to different trace sources. For example, you can log all messages from `Kofax.CEBPM.CPUServer.Core` and log only errors from `Kofax.CEBPM.CPUServer.Common`.

For more information on tracing and tracing options, refer to Microsoft documentation available at the Microsoft website.

Example: Text log with timestamps in different formats

This example defines the configuration of `DateTimeTaggedTraceListener`.

```
<!--
    initializeData for DateTimeTaggedTraceListener should have the following
    format:
        initializeData="<file name>;<format>"
        or initializeData="<file name>"

    where:
        <file name> is the log file name;
        <format> is the desired date time format;

    If <format> is not specified, the default format, "MM/dd/yyyy hh:mm:ss.fff tt" is
    used.
    For more information on date time format strings, refer to Microsoft documentation at
    the Microsoft web site.
-->
<add name="CPUServerLogTxt"
type="Kofax.CEBPM.CPUServer.Common.Diagnostics.DateTimeTaggedTraceListener,
Kofax.CEBPM.CPUServer.Common" initializeData="KofaxCPUServerLog.log" >
<filter type="System.Diagnostics.EventTypeFilter" initializeData="All"/>
</add>
```

Data Layer

This section provides information on configuring error logging for the Data Layer.

The Data Layer uses the standard .NET logging. The logging configuration is stored in `TotalAgility Web.config`, `Agility.Server.Core.WorkerService.exe.config` and `Kofax.CEBPM.CPUServer.ServiceHost.exe.config`.

You can configure logging to use different outputs, such as event log and log file.

Multiple trace sources include:

- **Kofax.CEBPM.DataLayer:** The main Data Layer trace source that contains majority of the important log statements.
- **Kofax.CEBPM.DataLayer.NHibernate:** The Supplementary NHibernate logging that contains a lot of information. Use with care.
- **Kofax.CEBPM.DataLayer.Imaging:** Contains information about the image processing operations.
- **Kofax.CEBPM.DataLayer.PdfLibrary:** Contains information about the PDF related operations.

Example: Logging configuration

```
<?xml version="1.0" encoding="utf-8" ?>
<configuration>
  <system.diagnostics>
```

```

<trace autoflush="true"/>
<sources>
  <!-- Main Data Layer trace source - contains majority of important log statements
-->
  <source name="Kofax.CEBPM.DataLayer" switchValue="Warning">
    <listeners>
      <clear/>
      <add name="DataLayerAll"/>
    </listeners>
  </source>
  <!-- Supplementary NHibernate logging, use with care - it contains a LOT of
information -->
  <source name="Kofax.CEBPM.DataLayer.NHibernate" switchValue="Warning">
    <listeners>
      <clear/>
      <add name="DataLayerAll"/>
    </listeners>
  </source>
</sources>
<sharedListeners>
  <add name="DataLayerAll" initializeData="Kofax.CEBPM.DataLayer.log"
type="System.Diagnostics.XmlWriterTraceListener"/>
</sharedListeners>
</system.diagnostics>
</configuration>

```

Capture Client

This section provides information on configuring error logging for Capture Client.

Capture Client uses the standard .NET logging. The logging configuration is stored in TotalAgility Web.config.

You can configure logging to use different outputs, such as event log and log file.

Example: Logging configuration

```

<system.diagnostics>
  <trace autoflush="true">
    <listeners>
      <add name="CaptureClientServer"
        traceOutputOptions="DateTime,ThreadId"
        type="System.Diagnostics.TextWriterTraceListener"
        initializeData="c:\CaptureClientServerLog.txt">
      <filter type="System.Diagnostics.EventTypeFilter"
        initializeData="Warning" />
      </add>
    </listeners>
  </trace>
</system.diagnostics>

```

Where,

- traceOutputOptions: Defines the additional data to each log statement (DateTime, ThreadId).
- type: Defines the type of logging, such as text file.
- initializeData: Defines the path to the log file.
- (Filter) initializeData: Defines the trace level (Off, Critical, Error, Warning, Information, Verbose or All).

TotalAgility Reporting Server

This section provides logging diagnostic information for the TotalAgility Reporting Server. The logging configuration is stored in the Kofax.CEBPM.Reporting.TAService.exe.config and Kofax.CEBPM.Reporting.AzureETL.exe.config files.

The logging mechanism is similar to Transformation Server or Data Layer that uses the Microsoft .NET diagnostics. The source name for the Reporting messages is "Reporting".

By default, both the files use customized trace listener Kofax.Reporting.Common.Logging.TenantBasedTraceListener. This listener allows automatic separation of logs by tenant.

The following XML displays the System.Diagnostics sections from Kofax.CEBPM.Reporting.AzureETL.exe.config and Kofax.CEBPM.Reporting.TAService.exe.config.

Example: System.Diagnostics in Kofax.CEBPM.Reporting.AzureETL.exe.config

```
<system.diagnostics>
  <trace autoflush="true"/>
  <switches>
    <add name="TraceLevelSwitch" value="Warning"/>
  </switches>
  <sources>
    <source name="Reporting" switchName="TraceLevelSwitch">
      <listeners>
        <clear/>
        <add name="TextDiagnostics"/>
      </listeners>
    </source>
  </sources>
  <sharedListeners>
    <!--Using customized Listener which can generate log file name based on tenant
    name (if used {0} placeholder in the name).
    By default, logs folder is C:\ProgramData\Kofax\TotalAgility\Reporting\Log-->
    <add name="TextDiagnostics"
    type="Kofax.Reporting.Common.Logging.TenantBasedTraceListener,
    Kofax.Reporting.Common"
    initializeData="C:\ProgramData\Kofax\TotalAgility\Reporting\Log\ETLApp_{0}.log">
    </add>
  </sharedListeners>
</system.diagnostics>
```

Example: System.Diagnostics in Kofax.CEBPM.Reporting.TAService.exe.config

```
<system.diagnostics>
  <trace autoflush="true"/>
  <switches>
    <add name="TraceLevelSwitch" value="Warning"/>
  </switches>
  <sources>
    <source name="Reporting" switchName="TraceLevelSwitch">
      <listeners>
        <clear/>
        <add name="ReportingLogTxt"/>
      </listeners>
    </source>
  </sources>
  <sharedListeners>
```

```

<!--By default logs folder is C:\ProgramData\Kofax\TotalAgility\Reporting\Log-->
<add name="ReportingLogTxt"
type="Kofax.Reporting.Common.Logging.TenantBasedTraceListener, Kofax.Reporting.Common"
initializeData="C:\ProgramData\Kofax\TotalAgility\Reporting\Log\WorkerRole.log">
  <filter type="System.Diagnostics.EventTypeFilter" initializeData="All"/>
</add>
</sharedListeners>
</system.diagnostics>

```

You can change the logging detailization by changing the "TraceLevelSwitch" value to any of the following values: Off, Critical, Error, Warning, Information, Verbose, All

You can change the location of the log file by modifying the value of the "initializeData" attribute of the "ReportingLogTxt" shared listener. The default path for the log files is "ReportingLogTxt".

Client-side reporting

You can enable logging in the Reporting client-side library that is used in the TotalAgility components to report data into Reporting Server.

To enable the Reporting client-side logging for these components, you must extend the existing System.Diagnostics section of TotalAgility Web.config, Agility.Server.Core.WorkerService.exe.config and Kofax.CEBPM.CPUServer.ServiceHost.exe.config with the following switches, sources and shared listeners.

Example: System.Diagnostics changes for the client-side reporting

```

<system.diagnostics>
  <trace autoflush="true"/>
  <switches>
    <add name="TraceLevelSwitch" value="Verbose"/>
  </switches>
  <sources>
    <source name="Reporting" switchName="TraceLevelSwitch">
      <listeners>
        <clear/>
        <add name="ReportingLogTxt"/>
      </listeners>
    </source>
  </sources>
  <sharedListeners>
    <add name="ReportingLogTxt" type="System.Diagnostics.TextWriterTraceListener,
system, version=1.0.3300.0, Culture=neutral, PublicKeyToken=b77a5c561934e089"
initializeData="Kofax.Reporting.Integration.log" />
  </sharedListeners>
</system.diagnostics>

```

We recommend that you use different log names in different Application configuration files if they are modified on the same machine.

For example, use initializeData="Kofax.Reporting.Integration_web.log" for Web.config, and initializeData="Kofax.Reporting.Integration_CPU_server.log" for the Transformation Server.

This will prevent mixing information logged by different instances of client-side library in one file.

Web Capture logging

You can enable the javascript logs using the browser console by setting the following parameter:

```
Atalasoftware.TraceEnabled = true
```

You can enable the Web Capture Service logging using the following configuration files:

- Kofax.WebCapture.Host.exe.log.config
- Kofax.WebCapture.ScanWorker.exe.log.config

To log all statements, set the following parameters:

```
DisableLogging=false  
Filter="%Severity% >= trace"
```

Available log levels are trace, debug, info, warning, error and fatal.

Network logging

The third party utilities, Fiddler and Wireshark, and developer tools built into the various browsers offer useful features to trace out HTTP requests.

Such utilities enable you to troubleshoot potential network issues.

License Server logging

You can enable custom logging for the license server by adding the following parameters to win.ini available at C:\Windows.

```
[KDB]  
File=On  
filename=C:\licensedebug.log
```

Appendix F

Performance counter usage

The Performance Counters are used to record application states and activities. Many are already included as part of the Windows operating system, and additional counters may be created programmatically. Counters are written and placed in an application where specific measurements need to be made, such as rate of throughput, count of items and others.

Once the counters are installed on a target system, an application can write values to them. These values can then be read in real-time using the Windows Performance Monitor, a Microsoft Management Console (MMC) snap-in.

TotalAgility has a number of Performance Counters; the placement of these within the application are used to measure Key Performance Indicators (KPIs) of a number of critical services which are detailed below.

Before using the TotalAgility Performance Counters, see the following guides for more information on TotalAgility internals:

- *Kofax TotalAgility Features Guide* (See System Options > Settings > Thread Pools.)
- *Kofax TotalAgility Architecture Guide*

Installation

The Performance Counters are automatically installed on the target machine when the following services are installed:

- CoreWorker Service
- Export Service

The installation requires no input from the user.

Data collection

The Performance Counter data is collected using the Microsoft Performance Monitor. When the monitor is launched, the installed counters can be selected and added to the current monitoring session.

Interpretation

Many factors, such as hardware specifications, network topology, virtualization, nature and quantity of work being processed, and the deployment configuration of TotalAgility influence TotalAgility performance.

Performance counters therefore should be viewed as indicative and used in conjunction with other approaches, such as logging and monitoring, to determine system health.

The most likely scenario of using the Performance Counters is the TotalAgility deployment that is operating a heavy load. In this case, counters indicate several things:

- Some counters, such as locked automatic activities, should always be at their maximum value (as set by configuration). Dips in performance can indicate contention, overloading, network issues, and more.
- Some worker tasks, such as the Archive Jobs Worker, are executed according to a configurable schedule. The associated counter should reflect this scheduled activity; any other result indicates that the system is not performing as expected.
- Thread pools and thread pool queue counters can indicate if long-running tasks are blocking execution and require scaling.

Locked automatic activities

This counter indicates the number of automatic activities taken up by TotalAgility to execute from the TotalAgility database. This number corresponds to the `MaximumNumberOfActivitiesToLock` setting in the `CoreWorker` configuration file, which has a factory value of 32. This counter should be used in conjunction with other counters, such as the thread pool queues, to determine if the system is efficiently servicing the tasks. If queues are not being serviced in a timely manner, possible remediation includes reducing the `MaximumNumberOfActivitiesToLock` value and / or increasing the thread pool size. Counters are available for the following services:

- CoreWorker Service
- Export Service

Worker tasks taken

This counter indicates the number of jobs-related worker tasks of each type that are due to be processed. These tasks are performed in the job and process activities thread pools, whose sizes are governed by the relevant thread pool sizes in the TotalAgility System Settings. Counters are available for the following worker task types:

- Archive Jobs Worker
- Create Exceptions Worker
- Create Jobs Worker
- Evaluate Jobs Worker
- Process Activity Worker
- Process Capture Timeouts Worker
- Process State Actions Worker

A consistently high reading here may indicate that the thread pool value needs to be increased, although this requires experimentation to find the best value for any given scenario. Counters are available for the `CoreWorker` service.

Active threads / Thread pools

This counter indicates the number of active threads per thread pool for the CoreWorker service. A consistently high reading here may indicate that scaling may need to be considered to accommodate the workload, either horizontal or vertical. Counters are available for the CoreWorker service.

Items / Thread pool queue

This counter indicates the number of items queued in the CoreWorker service thread pool and waiting to be added. A consistently high reading may indicate that scaling is required to accommodate the workload, either horizontal or vertical. Counters are available for the following services:

- CoreWorker Service
- Export Service

Uninstall

The Performance Counters are automatically uninstalled on the target machine when the following services are stopped:

- CoreWorker Service
- Export Service

The uninstallation requires no input from the user.

Logging

In general, Performance Monitor samples the performance counters every one second. While this provides sufficient information for most purposes, some scenarios may require a deeper level of detail which can be viewed in the log file. You can log each performance counter in TotalAgility log file by enabling the logging function as follows:

Enable logging in the Core Worker Service and Export Worker Service configuration files as follows:

1. Open `Agility.Server.Core.WorkerService.exe.config` and `Agility.Server.Core.ExportService.exe.config` located in the `CoreWorkerService` folder available at your installation location, for example, `C:\Program Files\Kofax\TotalAgility\CoreWorkerService`
2. Under the `<appSettings>` section, change the following value to **true**:
`<add key="PerformanceLoggingEnabled" value="false"/>`
3. Uncomment the **<system.diagnostics>** section in the service configuration files:

```
<system.diagnostics>
  <trace autoflush="true" indentsize="4">
    <listeners>
      <add name="KTALog" type="System.Diagnostics.TextWriterTraceListener"
initializedData="c:\temp\KTALog.txt">
      </add>
    </listeners>
```

```
</trace>  
</system.diagnostics>
```

Note Disable logging once finished, as continuous use will cause an unnecessary bloat in the log file.
